Table of Contents

List of Figures

List of Tables

Abbreviations and Acronyms

Acronym	Definition
AB	Assembly Bill
APM	Automated People Mover
AVE	Area of Visual Effect
BMP(s)	best management practice(s)
CAAQS	California Ambient Air Quality Standards
CalEEMod	California Emissions Estimator Model
CAP	Climate Action Plan
CARB	California Air Resources Board
CEQA	California Environmental Quality Act
CNEL	community noise equivalent level
CO	carbon monoxide
CO_2	carbon dioxide
CO_2e	carbon dioxide equivalent
CRHR	California Register of Historical Resources
dB	decibel
DoD	Department of Defense
DPM	diesel-exhaust particulate matter
EIS	Environmental Impact Statement
EIR	Environmental Impact Report
FAA	Federal Aviation Administration
GHG(s)	greenhouse gas(es)
HRA	health risk assessment
ITC	Intermodal Transit Center
KOP(s)	key observation points
LEED	Leadership in Energy and Environmental Design
NAAQS	National Ambient Air Quality Standards
NAVFAC	Naval Facilities Engineering Systems Command
NAVWAR	Naval Information Warfare Systems Command
Navy	Department of the Navy
NEPA	National Environmental Policy Act
NO_2	nitrogen dioxide
NO_x	nitrogen oxides
OTC	Old Town Campus
PCB(s)	polychlorinated biphenyls
PM_{10}	particulate matter less than or equal to 10 microns in diameter
$PM_{2.5}$	particulate matter less than or equal to 2.5 microns in diameter
RAQS	Regional Air Quality Strategy
ROI	region of influence
RTP	Regional Transportation Plan
SANDAG	San Diego Association of Governments
SCAQMD	South Coast Air Quality Management District
SDAB	San Diego Air Basin
SDAPCD	San Diego Air Pollution Control District
SDG&E	San Diego Gas and Electric
SHPO	State Historic Preservation Officer
SIP(s)	State Implementation Plans
SJVAPCD	San Joaquin Valley Air Pollution Control District
SMAQMD	Sacramento Metropolitan Air Quality Management District
SO_x	sulfur oxides
TAC(s)	toxic air contaminants
TDM	Transportation Demand Management
TPA	Transit Priority Area
UFC	Unified Facilities Criteria
U.S.	United States
USEPA	U.S. Environmental Protection Agency
VMT	vehicle miles traveled
VOC(s)	volatile organic compounds

1 Overview

While the Navy is not subject to requirements of the California Environmental Quality Act (CEQA), local agencies or private developer(s) involved in this project may need to satisfy CEQA in the future. Appendix A has been prepared to provide a basis if future CEQA level analysis is required. The Environmental Impact Statement (EIS) is not a joint National Environmental Policy Act (NEPA)/CEQA document.

1.1 Introduction

The United States (U.S.) Department of the Navy (Navy) prepared an EIS to evaluate the potential environmental consequences of the proposed modernization of Naval Base Point Loma Old Town Campus (OTC), San Diego, California. The federal Proposed Action would provide modern facilities to enhance Naval Information Warfare Systems Command's (NAVWAR's) operational effectiveness.

The proposed modernization of NAVWAR's facilities on OTC would include renovation or construction of new buildings, utilities, and infrastructure. To fulfill current and future mission requirements, the NAVWAR facilities must comply with seismic safety design and anti-terrorism force protection standards, provide controlled site access, and be supplied by independent utility systems in all spaces designated as secure. Modernization would be accomplished in either of two ways:

1. Navy Redevelopment: A Navy-only project that would construct new or renovate existing NAVWAR facilities at OTC. No public-private or mixed-use development would occur on OTC under this scenario.
2. Public-private Redevelopment: Collaboration between the Navy, the private sector, and possibly other government agencies to finance and construct new NAVWAR facilities at OTC. Development would include new facilities for NAVWAR and a range of private mixed-use development (e.g., residential, office, retail, hotel). The developers of the mixed-use development would pay for construction of NAVWAR facilities in exchange for the opportunity to develop the remaining OTC land. Two of the action alternatives analyzed in the EIS include consolidation of a transit center to OTC.

As part of the Navy's Request for Interest to gauge interest and solicit ideas for the redevelopment of OTC through a public-private redevelopment arrangement, the San Diego Association of Governments (SANDAG) identified OTC as a potential location for a transit center. SANDAG also expressed interest in OTC as a potential location for a Central Mobility Hub. The Central Mobility Hub would be as a new multimodal regional transportation facility linking the San Diego region with regional transit and the San Diego International Airport. SANDAG and the Navy signed an agreement on September 19, 2019 and a follow-on agreement on January 23, 2020 defining collaboration between the agencies regarding the potential redevelopment of OTC with new NAVWAR facilities, mixed-use private development, and a transit center. These are included as Appendix P of the EIS. If the Navy decides to pursue an Alternative that includes a transit center, SANDAG may decide to, in the future, develop the proposed transit center into the Central Mobility Hub. Alternatives 4 and 5 include the consolidation of a transit center on OTC, but not an increase in transit or a connection to the airport as proposed by the Central Mobility Hub. SANDAG is also a cooperating agency for the development of the EIS pursuant to NEPA and associated regulations.

Appendix A analyzes additional topics required under CEQA. If the Navy transfers property out of federal ownership or selects an alternative in which SANDAG has a role in the private development, the private developer or SANDAG may be able to utilize the EIS to help meet future CEQA compliance obligations. In the event that future actions taken by the Navy, SANDAG, or a private developer are outside the scope of this EIS, subsequent NEPA or CEQA may be required. The EIS is not a joint NEPA/CEQA document and future CEQA actions would be the responsibility of the appropriate state or local agency or private developer. Compliance with CEQA is not required for the Navy to select an alternative and publish a NEPA Record of Decision.

This appendix presents the additional analysis for Alternatives 4 and 5 for CEQA that would be above those already discussed in the EIS. These alternatives represent the highest levels of potential development for each use type and include the potential development of a consolidated transit center.

CEQA applies to discretionary actions of California state and local public agencies that may result in a direct or reasonably foreseeable indirect change to the physical environment. CEQA requires the preparation of an Environmental Impact Report (EIR) where there is a fair argument, based on substantial evidence, that the action may result in a potentially significant environmental impact. CEQA and CEQA-implementing regulations promulgated by the California Natural Resources Agency set forth the requirements that apply to the preparation of EIRs. CEQA (Public Resources Code section 21083.7) and CEQA-implementing regulations (California Code of Regulations, title 14, section 15221) allow agencies to rely on an EIS prepared pursuant to NEPA for purposes of CEQA compliance in lieu of preparing a separate EIR, if the EIS satisfies CEQA's requirements for EIRs.

CEQA compliance would be required prior to state or local discretionary actions and approvals necessary to implement Alternatives 4 and 5. Specifically, CEQA would apply to (1) SANDAG entering into a lease or property conveyance agreement with the Navy to obtain control of all or a portion of OTC from the Navy, (2) commercial development of OTC by SANDAG or private entities selected by SANDAG pursuant to its agreement with the Navy, and (3) the development of a consolidated transit facility at OTC.

In addition to the general CEQA framework described above, the California legislature recently approved Assembly Bill (AB) 2731, which expressly provides that SANDAG may acquire control of OTC property prior to completing CEQA environmental reviews and may rely on the Navy EIS to meet its CEQA requirements for transit-oriented private commercial development of OTC, provided certain other requirements in AB 2731 are met. AB 2731 would require SANDAG to prepare a standalone CEQA EIR prior to development of a Central Mobility Hub and related transit facilities at OTC.

The purpose of this CEQA Evaluation Appendix is to (a) present an analysis of potential impacts to the environment from project Alternatives 4 and 5, conducted in accordance with CEQA, and (b) comply with Public Resources Code 2100-21189 and the California Code of Regulations, title 14, division 6, chapter 3, sections 15000-15387. This appendix presents CEQA analysis for Alternatives 4 and 5, which represent the highest levels of potential development for each use type and include the potential consolidation of a transit center. Because this appendix considers the highest levels of potential impact, the analysis would also be applicable if Alternative 2 or 3 is selected.

1.2 SANDAG's Regional Transportation Plans

This section provides background on SANDAG's planning processes and involvement with the Navy's proposed revitalization at OTC. Additional background information on the Proposed Action (including the purpose and need) are in Chapter 1 of the EIS.

Every 4 years, SANDAG prepares and updates a Regional Plan in collaboration with the 18 cities and County of San Diego along with regional, state, and federal partners. The current Regional Plan (San

Diego Forward: the 2015 Regional Plan) was approved in October 2015 by the San Diego Board of Directors. The Regional Plan provides a blueprint for a sustainable future for the San Diego region by addressing the following items: future transportation goals (2050 and beyond), population distribution, transportation methods, and growth strategies based on multiple factors (creating economic growth, preserving the environment, meeting the needs of city residents, and maintaining quality-of-life).

SANDAG is developing a new Regional Plan (San Diego Forward: The 2021 Regional Plan) that reimagines how people and goods move in the 21st century. SANDAG is applying key strategies, known as the 5 Big Moves, to envision a balanced transportation network that leverages technology to create a safe, adaptable, and socially equitable transportation ecosystem that responds to the unique needs of the diverse communities throughout the region. On October 8, 2019, California AB 1730 (Gonzalez) was signed into law that extended development of a new vision for the 2021 Regional Plan to late 2021. In the interim, SANDAG prepared a 2019 Federal Regional Transportation Plan (RTP) that complies with federal requirements for the development of regional transportation plans, achieves air quality objectives of the U.S. Department of Transportation, and preserves funding for the region’s transportation investments.

The 2019 Federal RTP adds to San Diego Forward: The 2015 Regional Plan with updated project costs and revenues and a new regional growth forecast. The 2019 Federal RTP is consistent with the Final EIR for the 2015 Regional Plan approved by the SANDAG Board of Directors on October 9, 2015.

1.2.1 Airport Connectivity Planning

Increasing regional connectivity to the San Diego International Airport is a key planning objective of the 2019 RTP. In 2009, SANDAG, the Airport Authority, and the City of San Diego completed a study entitled Destination Lindbergh, which detailed a planning strategy for the ultimate buildout of San Diego International Airport at its present location (San Diego Regional Airport Authority, 2009). The document evaluated improved intermodal access to the airport and determined actions that could reduce traffic on surrounding arterial streets. Also envisioned was a consolidated rental car center on the north side of the airport, which opened in 2016, and the development of an Airport Intermodal Transit Center (ITC) along the existing rail corridor to provide direct connections to Amtrak, COASTER, trolley, bus services, and the southern terminus for the proposed high-speed train service. Also planned were direct connector ramps from Interstate 5 to Pacific Highway that would improve access to and from the airport.

In 2018, the Airport Authority and the Port of San Diego completed the multimodal studies for both Harbor Drive (Kimley Horn, 2017) and North Harbor Drive (Port of San Diego, 2018), which focused on off-airport multimodal solutions within each of their respective jurisdictions. Through creation of the Airport Connectivity Subcommittee, SANDAG built upon these study areas to include critical sections of northern Pacific Highway and capture proposed mid- and long-term transit projects that could not be assessed in these previous studies. The ITC was included in one of the concepts advanced to the SANDAG Board as part of the Airport Subcommittee’s work in 2019.

Four concepts were reviewed by the Airport Connectivity Subcommittee: Concepts 1 and 2 feature a Central Mobility Hub at OTC (where NAVWAR’s headquarters are located), which includes a multimodal transportation center with high-frequency Automated People Mover (APM) service.

- Concept 1 features a Central Mobility Hub at OTC, including a multimodal transportation center with high-frequency APM service and assumes a nonstop, high-speed service to San Diego International Airport via a 1-mile tunnel route.
- Concept 2 also features the Central Mobility Hub and APM service as noted for Concept 1 but assumes service to San Diego International Airport via a 3.6-mile surface/elevated APM route along Pacific Highway, Laurel Street, and Harbor Drive with intermediate stops at the airport rental car center and the planned development at Harbor Island East Basin.
- Concept 3 also includes a Central Mobility Hub but focuses on a multimodal transportation center with numerous connections to regional transit lines, excluding Amtrak and COASTER services, and with high-frequency APM service to San Diego International Airport, and an airport-like curb system for auto-based travelers. An APM station would provide service to San Diego International Airport via a 2.6-mile surface/elevated route along Pacific Highway, Laurel Street, and Harbor Drive, with intermediate stops at the airport rental car center and planned development at Harbor Island East Basin. (Note: The Central Mobility Hub is a separate concept from the Airport ITC described earlier in this chapter and identified in the 2015 Regional Plan/2019 Federal RTP. The Central Mobility Hub is anticipated to include new regional transit services and connections to the San Diego International Airport.)
- Concepts 4a and 4b include extension of the trolley system to the planned San Diego International Airport transit station with an intermediate stop at the planned development at Harbor Island East Basin.

On September 27, 2019, the SANDAG Board of Directors approved the conceptual transportation solutions included in the Airport Connectivity Analysis for further study and environmental analysis (SANDAG, 2020a). The intent of the analysis was to have enough data on each of the conceptual transportation solutions so that the Board is ultimately able to select a preferred solution.

Throughout 2019 and 2020, SANDAG worked to build consensus to develop concepts that would not only enhance passenger and visitor experience with a high-quality transit connection to the airport, but also address anticipated congestion on key airport access roads, including freeway and roadway modifications. In February and March 2020, SANDAG, the City of San Diego, the Airport Authority, and San Diego Unified Port District entered into a memorandum of understanding regarding transportation projects at or near the San Diego International Airport, agreeing to work together to create a regional transportation plan that provides enhanced transit connections to the airport and improves roadway access, multimodal circulation, and reduces congestion around the airport and port area.

1.2.2 Discretionary Actions and Approvals Necessary to Implement Alternative 4 or 5

The Navy identified five alternatives in the EIS. Two of those alternatives, Alternatives 4: Public-Private Development–NAVWAR and Higher Density Mixed Use with Transit Center (Preferred Alternative) and Alternative 5: Public-Private Development–NAVWAR and Lower Density Mixed Use with Transit Center, consider the redevelopment of OTC to include Navy, transit, and transit-oriented development. If selected by the Navy, Alternative 4 or 5 could require certain discretionary permits, approvals, or agreements, including:

- A lease or property conveyance between the Navy and a public-private developer or SANDAG, setting out the terms of the redevelopment of OTC

- Public-private sector development agreements for the redevelopment of OTC to include modernized Navy facilities and mixed-use development
- Other agency, permits, approvals or agreements (e.g., encroachment permits and rights-of-way from Caltrans, utilities arrangements, and possible involvement of the City of San Diego)

1.2.3 Public-Private Sector Development Agreements Addressing Navy, SANDAG, and Mixed-Use Development

SANDAG expects that development of a transit center would not require private funding, but SANDAG would coordinate with any public-private partnership to integrate the future transit center into the design of the mixed-use development. The agreements for private development could take the form of leases or subleases with developers, or fee transfer of property. Additional or supplemental NEPA and CEQA review may be required prior to the approval of such agreements and/or prior to the approval of specific development projects at OTC.

1.2.4 Formation of a Joint Powers Agency, Community Facilities District, or Similar Mechanism to Finance and Oversee Construction of Mixed-Use Development

Formation of a joint powers agency, pursuant to the Joint Exercise of Powers Act (California Government Code sections 6500-6599.3), Community Facilities District pursuant to the Mello-Roos Community Facilities Act of 1982 (California Government Code sections 53311-53368.3), enhanced infrastructure financing district (California Government Code section 53398.50), or a similar mechanism may occur to fund and oversee the construction of mixed-use development on OTC.

1.2.5 Actions That Exceed the Scope of the Analysis in the EIS

Alternatives 2-5 of the EIS cover development of new NAVWAR facilities and mixed-use private development. Alternatives 4 and 5 also include consolidation of a transit center on OTC. If the Navy selects Alternative 4 or 5 and if SANDAG's Board of Directors selects OTC as the location for a Central Mobility Hub, additional CEQA review of the Central Mobility Hub would be required prior to SANDAG making any decision or irretrievable or irreversible commitment with respect to approval of transit uses on the site. Alternatives 4 and 5 analyze the development of transit uses on OTC at a general level and include transit services similar to the Old Town Transit Center. Specific details on the transit center would be determined between the transit operators (Metropolitan Transit Service and the North County Transit District). Specific details on the Central Mobility Hub are not known at this time and would be subject to a separate standalone environmental review. However, since OTC is a potential location for the Central Mobility Hub, the proposal is addressed under cumulative impacts.

In addition, the EIS has envisioned that new transportation infrastructure maybe necessary to alleviate traffic congestion around OTC. These improvements have been included in the EIS as potential mitigation. Subsequent environmental clearance will be required when more detailed design and engineering is completed.

1.3 Structure of Appendix

This CEQA Evaluation Appendix is structured to meet environmental impact analysis criteria as set forth in Appendix G of the Guidelines for Implementation of the CEQA, while avoiding duplication of analyses performed in the EIS. Resource-specific impact analyses in this evaluation are organized under the relevant section headings of the EIS for cross-referencing. Table 1-1 cross-references the Appendix G issue area analyses within this appendix to the corresponding NEPA issue area analyses in the EIS. Issue areas are presented in the same order as the EIS and are shown in Table 1-1. The CEQA Initial Environmental Checklist Form tables are presented with each respective resource discussion in Chapter 2.

Table 1-1 CEQA/NEPA Analysis Index

CEQA Issue Areas[1]	*Comparable NEPA Issue Areas (includes Section # for the EIS)*
III. Air Quality	3.1 Air Quality
VIII. Greenhouse Gas Emissions	3.1 Air Quality
XVII. Transportation	3.2 Transportation
I. Aesthetics	3.3 Visual Resources
XI. Land Use/Planning	3.4 Land Use
XVI. Recreation	3.4 Land Use
XIV. Population/Housing (including growth inducement)	3.5 Socioeconomics
V. Cultural Resources	3.6 Cultural Resources
XVIII. Tribal Cultural Resources	3.6 Cultural Resources
IX. Hazards & Hazardous Materials	3.7 Hazardous Materials and Wastes
XX. Wildfire	3.8 Public Health and Safety
XV. Public Services	3.10 Public Services
VI. Energy	3.11 Infrastructure
XIX. Utilities/Service Systems	3.11 Infrastructure
XIII. Noise	3.13 Noise
VII. Geology/Soils	3.14 Geological Resources
XII. Mineral Resources	3.14 Geological Resources
X. Hydrology/Water Quality	3.15 Water Resources, 3.11 Infrastructure
IV. Biological Resources	3.16 Biological Resources
II. Agriculture and Forestry Resources	NA
XXI. Mandatory Findings of Significance	5 Other Considerations Required by NEPA

Note: (1) Appendix G of the Guidelines for Implementation of the CEQA.

1.4 No Action/No Project Alternative

Under the No Action Alternative, the Navy would continue to maintain and repair the existing facilities. NAVWAR would continue to operate at OTC and no change from the status quo would occur. The No Action Alternative will be used to analyze the consequences and potential environmental impacts of not undertaking the Proposed Action and will serve to establish a comparative baseline for analysis. Additional information on the No Action Alternative is in Section 2.3.1 of the EIS.

1.5 Alternative 4: Public-Private Development–NAVWAR and Higher Density Mixed Use with a Transit Center (Preferred Alternative)

This alternative would include the construction of new Navy facilities for NAVWAR on OTC through a public-private development agreement, and the relocation of some Naval Information Warfare Command Pacific functions. The development requirements for NAVWAR are listed in Table 1-2. Sustainable development concepts would be applied throughout the development with specific

Department of Defense (DoD) guidelines applied to the NAVWAR facilities. The public-private development for OTC includes mixed use (residential, hotel, office, and retail) and a transit center. Construction would begin in 2021 and continue for a period of approximately 30 years. The NAVWAR requirements would be constructed first, over a period of 5 years. Phasing over the remaining 25 years would be based on a variety of development and real estate factors. In general, it is assumed 25 percent of all uses (residential, commercial, retail, and hotel) would be developed by year 10, 45 percent by year 15, 65 percent by year 20, 85 percent by year 25, and full buildout accomplished by year 30. Table 1-2 presents the development assumptions for Alternative 4.

Table 1-2 Alternative 4 Development Assumptions

Development Details	*Alternative 4*
NAVWAR Redevelopment	***Total Square Feet (Equivalent Unit)***
Office	845,326
Laboratory	165,614
Secure Conference/Auditorium	29,156
Warehouse/Storage	24,172
Open Storage	Not applicable
Parking	630,000 - (2,000 stalls)
NAVWAR Redevelopment Total	**1,694,268**
Public-Private Development – Higher Density	***Total Square Feet (Equivalent Unit)***
Residential	9,600,000 - (10,000 units)
Residential-Parking	5,040,000 - (14,400 stalls)
Office	1,350,000
Office-Parking	708,750 - (2,025 stalls)
Hotel	290,000 - (2 hotels, 450 rooms)
Hotel-Parking	157,500 - (450 stalls)
Retail	250,000
Retail-Parking	183,750 - (525 stalls)
Transit Center	140,000
Transit Center-Parking	175,000 - (500 stalls)
Public-Private Development Total	**17,895,000**
GRAND TOTAL	**19,589,268**

Note*:* (1) Parking square feet is estimated to accommodate all the use types included under this alternative.

Additional information on Alternative 4 is provided in Section 2.3.6 of the EIS.

1.6 Alternative 5: Public-Private Development–NAVWAR and Lower Density Mixed Use with a Transit Center

This alternative is similar to what is described above for Alternative 4, but the development envelope for private development is slightly reduced. The development requirements for NAVWAR are the same as under Alternative 2. Table 1-3 presents the development assumptions for Alternative 5.

Table 1-3 Alternative 5 Development Details

Development Details	***Alternative 5***
NAVWAR Redevelopment	***Total Square Feet (Equivalent Unit)***
Office	845,326
Laboratory	165,614
Secure Conference/Auditorium	29,156
Warehouse/Storage	24,172
Open Storage	Not applicable
Parking	630,000 - (2,000 stalls)
NAVWAR Redevelopment Total	**1,694,268**
Public-Private Development – Lower Density	***Total Square Feet (Equivalent Unit)***
Residential	7,680,000 - (8,000 units)
Residential-Parking	4,032,000 - (11,520 stalls)
Office	850,000
Office-Parking	446,250 - (1,275 stalls)
Hotel	290,000 - (2 hotels, 450 rooms)
Hotel-Parking	157,500 - (450 stalls)
Retail	200,000
Retail-Parking	147,000 - (420 stalls)
Transit Center	140,000
Transit Center-Parking	175,000 - (500 stalls)
Public-Private Development Total	**14,117,750**
GRAND TOTAL	**15,812,018**

Note: [1] Parking square feet is estimated to accommodate all the use types included under this alternative.

Additional information on Alternative 5 is provided in Section 2.3.7 of the EIS.

2 Environmental Impact Analysis

This section provides the environmental impact analysis based on criteria set forth in Appendix G of the Guidelines for Implementation of the CEQA. The chapter is organized consistent with the NEPA resource ordering in Chapters 3 and 4 of the EIS (see Table 1-1 for a comparison of CEQA and NEPA resources addressed in this document). The approach for levels of impact significance common to all resources analyzed in this appendix is described below:

- Potentially Significant: An impact is considered *potentially significant* if the analysis concludes that it could have a substantial adverse effect on the environment.
- Less Than Significant with Mitigation Incorporated: An impact is considered *less than significant with mitigation incorporated* if the analysis concludes that it would cause no substantial adverse change to the environment with the inclusion of environmental commitments that have been made by the applicant of the Proposed Action.
- Less Than Significant: An impact is considered *less than significant* if the analysis concludes that it would cause no substantial adverse change to the environment and requires no mitigation.
- No Impact: A finding of *no impact* is appropriate if the analysis concludes that the Proposed Action would not affect the particular topic area in any way.
- Mitigation: Mitigation under CEQA includes:

o Avoiding the impact altogether by not taking a certain action or parts of an action.

o Minimizing impact by limiting the degree or magnitude of the action and its implementation.

o Rectifying the impact by repairing, rehabilitating, or restoring the impacted environment.

o Reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action.

o Compensating for the impact by replacing or providing substitute resources or environments.

- Residual Impacts: A Residual impact is any impact that would remain as a result of the project after mitigation has been implemented, or that could not be fully avoided or eliminated by mitigation.

CEQA does not require a co-equal level of analysis for all alternatives. Therefore, a detailed analysis for each significance criterion is presented for Alternative 4 as the preferred project, and a summary of similarities and differences is provided for Alternative 5.

2.1 Air Quality and Greenhouse Gas Emissions

This section presents estimates of air quality and greenhouse gas (GHG) impacts that could occur under CEQA from implementation of project Alternatives 4 and 5. The region of influence (ROI) for assessing air quality impacts includes the immediate area surrounding OTC and the larger San Diego Air Basin (SDAB). Effects on air quality are based on estimated direct and indirect emissions associated with a project alternative. The analysis considered CEQA impacts related to air quality and GHG plan consistency, criteria pollutant emissions, ambient carbon monoxide (CO) hot spots, Toxic Air Contaminant (TAC) exposures, and GHG emissions. The EIS Appendix D includes detailed emissions inputs and calculation methods for each project alternative. Descriptions of the regulatory setting, environmental setting, and impact analysis approach are presented in EIS Sections 3.1.3, 3.1.4, and 3.1.5.2, respectively.

2.1.1 Impacts Determination

2.1.1.1 Impacts Summary

Table 2.1-1 presents a summary of impacts related to air quality and GHG emissions for each criterion specified in CEQA Appendix G Environmental Checklist Form. Explanation of each impact conclusion is provided in the following subsections.

Table 2.1-1 Impacts Related to Air Quality and Greenhouse Gas Emissions

Criteria	*Potentially Significant*	*Less than Significant with Mitigation*	*Less than Significant*	*No Impact*
III. Air Quality (AQ-) Where available, the significance criteria established by the applicable air quality management district or air pollution control district may be relied upon to make the following determinations. Would the project:	-	-	-	-
a) Conflict with or obstruct implementation of the applicable air quality plan?	**X**	-	-	-
b) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is nonattainment under an applicable federal or state ambient air quality standard?	-	**X**	-	-
c) Expose sensitive receptors to substantial pollutant concentrations?	**X**	-	-	-
d) Result in other emissions (such as those leading to odors adversely affecting a substantial number of people?	-	-	**X**	-
VIII. Greenhouse Gas Emissions (GHG-) Would the project:	-	-	-	-
a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?	-	-	**X**	-
b) Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?	-	-	**X**	-

Legend: - = no data in cell; X = selection for Alternatives 4 and 5.

Approach for the Determination of Significance

To evaluate Criterion AQ-a, the analysis determined consistency of Alternatives 4 and 5 with the Regional Air Quality Strategy (RAQS), which the San Diego Air Pollution Control District (SDAPCD) developed to attain the California ambient air quality standards. The analysis also determined consistency of Alternatives 4 and 5 with the applicable federal air quality plan (i.e., the State Implementation Plans [SIPs]), based on the General Conformity applicability findings in EIS Section 3.1.5.7).

Regarding Criterion AQ-b, the SDAPCD established emission thresholds to determine when a new or modified stationary source would require an air quality analysis. The city included these thresholds in its CEQA Significance Determination Thresholds as a consideration when determining the potential significance of air quality impacts for projects within the city (City of San Diego, 2016a). These thresholds are shown in Table 2.1-2 and were used as screening-level thresholds to evaluate whether project-related emissions would potentially cause a significant impact on air quality. Emissions less than the screening-level thresholds would not cause a significant impact under CEQA. Additionally, the analysis included a discussion under this criterion linking the project's significant criteria pollutant emissions to potential adverse human health effects.

Table 2.1-2 Air Quality Impact Screening Emission Thresholds

Pollutant[(1)(2)]	*Pounds per Day*	*Tons per Year*
NO_x	250	40
SO_x	250	40
CO	550	100
PM_{10}	100	15
VOC	137	15
$PM_{2.5}$[(3)]	67	10

Legend: NO_x = Nitrogen oxides; SO_x = sulfur oxides; CO = carbon monoxide; PM_{10} = particulate matter less than 10 microns in diameter; VOC = volatile organic compounds; $PM_{2.5}$ = particulate matter less than 2.5 microns in diameter.

Notes: (1) The city also provided maximum hourly thresholds of 25 pounds per hour for NO_x and SO_x, and 100 pounds per hour for CO. However, this analysis used only the daily and annual thresholds because CalEEMod generates only daily and annual emissions.

(2) The city also provided thresholds for lead; however, lead emissions were not quantified because the alternatives would have no source of substantial lead emissions (see EIS Section 3.1.4). Management Measure HAZ MGMT-1 (see EIS Section 3.7.3.7) would require the Navy to complete a demolition plan to prevent emissions associated with lead-based paint during demolition.

(3) The city did not set a threshold for $PM_{2.5}$. However, SDAPCD Resolution 16-041, adopted on April 27, 2016, amended Rule 20.2 to include a threshold for $PM_{2.5}$.

Source: City of San Diego, 2016.

Regarding Criterion AQ-c, the analysis conducted a quantitative health risk assessment (HRA) of diesel particulate matter (DPM) emissions associated with construction of Alternatives 4 and 5. The HRA results were compared to the following SDAPCD thresholds to determine significance (SDAPCD, 2013):

- Maximum incremental cancer risk equal to or greater than 10 in 1 million.
- Cancer burden equal to or greater than 1.0.
- Total chronic noncancer health hazard index equal to or greater than 1.0.

For operational TAC emissions, the analysis provides a qualitative discussion of the potential for impacts to sensitive receptors. The analysis also referred to EIS Section 3.1.5, *Air Quality*, for evaluations of the potential for (a) project-generated traffic to contribute to CO hot spots; (b) nearby emission sources to expose future project residents to TACs; and (c) project demolition to expose sensitive receptors to airborne hazardous materials, such as asbestos, lead-based paint, polychlorinated biphenyls (PCBs), and mercury.

Regarding Criterion AQ-d, the analysis evaluated the potential for project construction and operation to generate odors that would impact a considerable number of receptors.

Regarding Criterion GHG-a, the analysis quantified construction and operational GHG emissions for Alternatives 4 and 5. Neither the SDAPCD nor the City of San Diego has adopted mass emission thresholds for GHG emissions under CEQA. Therefore, this analysis evaluated the significance of GHG impacts by determining consistency of Alternatives 4 and 5 with the City of San Diego Climate Action Plan (CAP) (City of San Diego, 2016b), as presented under the evaluation of Impact Criterion GHG-b. The CAP Final Program EIR and amendment serve as a Qualified GHG Reduction Plan under CEQA Guidelines section 15183.5 (City of San Diego, 2015; City of San Diego, 2016c). CEQA Guidelines section 15183.5 permits discretionary projects under CEQA that are consistent with the CAP to tier off the GHG analysis in the CAP Final Program EIR. A project's incremental contribution to a cumulative GHG emissions effect may be determined not to be cumulatively considerable if the project complies with the requirements of the CAP. Compliance with the CAP is determined by assessing the project with respect to the CAP Checklist (City of San Diego, 2017).

Relative to Criterion GHG-b, the analysis evaluated consistency of Alternatives 4 and 5 with applicable plans related to GHG emissions, including the CAP Checklist as presented in the city's CEQA Significance Determination Thresholds.

2.1.1.2 No Action/No Project Alternative Impacts

The impacts of the No Action Alternative for air quality and GHG emissions are described in EIS Section 3.1.5.3, *Air Quality*. The No Action Alternative would result in less than significant impacts to air quality and GHG emissions.

2.1.1.3 Alternative 4 Impacts

AQ-a: Conflict with or obstruct implementation of the applicable air quality plan?

Potentially Significant Impacts.

Consistency with the RAQS

Projects that are consistent with the assumptions and emission forecasts used in the development of the RAQS are considered to not conflict with or obstruct implementation of the RAQS. The RAQS emissions forecasts rely on projections of vehicle miles traveled (VMT) by SANDAG, and population, employment, and land use projections made by the City of San Diego during development of the general plan and area plans. As such, a development project that is consistent with the growth anticipated by the general plan and applicable area plan would be consistent with the RAQS. If a development project would exceed the plans' growth projections, the project would conflict with the RAQS and could potentially result in a significant air quality impact.

OTC lies within the 1,324-acre Midway-Pacific Highway Community. OTC, the U.S. Marine Corps Recruit Depot, and commercial land uses comprise most of the land area in the community. The community also includes some industrial, residential, and institutional uses. The city's current Midway-Pacific Highway Community Plan (Community Plan) provides community development assumptions for a 30-year planning horizon (year 2045). Table 2.1-3 lists these assumptions and compares them to proposed Alternative 4 at buildout. The table shows that Alternative 4 would account for more than 60 percent of the population growth and nearly 100 percent of the dwelling unit growth forecast for the entire community in the Community Plan. Alternative 4 would also generate about three times the jobs growth and six times the nonresidential building space growth forecast for the entire community in the Community Plan.

Table 2.1-3 Development Assumptions for Alternative 4 Compared to the Midway-Pacific Highway Community

Land Use Metric	*Community Plan Horizon Year Assumption(1)*	*Alternative 4 Buildout(2)*	*Alternative 4 Percent of Community Plan Assumption*
Increase in residents	23,660	14,364	61%
Increase in dwelling units	10,155	10,000	98%
Increase in jobs	4,370	13,273	304%
Increase in nonresidential square feet	300,000	1,831,754	611%

Notes: (1) *Midway-Pacific Highway Community Plan*, Table 2-2 (City of San Diego, 2018). Horizon year is 2045 (30 years after base year).
(2) Alternative 4 data for residents, dwelling units, and nonresidential square feet are from the EIS Appendix D, Table D3.1-19 (Alternative 4 minus existing; parking structures were excluded from nonresidential square feet). Alternative 4 data for jobs are from EIS Section 3.5, *Socioeconomics*, which reported 18,241 jobs at buildout, minus 4,968 employees at the existing OTC (G. Geisen, NAVWAR, personal communication, February 17, 2020).

At the individual level, Alternative 4 would be within the residential growth projections, but above the employment and commercial growth projections for the Midway-Pacific Highway Community. At the cumulative level, Alternative 4, in conjunction with other proposed residential and mixed-use projects, would most likely exceed the residential growth projections for the Midway-Pacific Highway Community. (For additional information on these projections, see Section 2.4, *Land Use*, Impact LU-b.) Therefore, Alternative 4—both individually and in combination with other projects considered in the cumulative setting—would generate vehicular emissions that exceed the levels estimated in the RAQS. As a result, Alternative 4 would conflict with implementation of the RAQS and could have a potentially significant impact on regional air quality.

Consistency with the State Implementation Plan

With respect to the national ambient air quality standards, EIS Section 3.1.5.7 demonstrated that Volatile Organic Compound (VOC) and nitrogen oxides (NO_x) emissions associated with construction and operation of Alternative 4 would be less than the applicable General Conformity *de minimis* thresholds. Therefore, Alternative 4 would not conflict with or obstruct implementation of the SIP.

Mitigation Measures and Residual Impacts

The mitigation measure described below would help reduce the potentially significant impacts related to conflicts with the RAQS.

> **MM AQ-1.** Within 6 months of the completion of the Record of Decision, and every 3 years thereafter until buildout, the Navy shall provide SANDAG with population and employment projections for OTC, which should be used by (1) SANDAG to update its regional growth projections; and (2) the SDAPCD to update the emission estimates and forecasts presented in its regional air quality plans.

MM AQ-1 would reduce significant impacts of Alternative 4 by requiring the Navy to provide the information needed to update the RAQS. However, as updates to the air quality plans are within the SDAPCD's jurisdiction, the effectiveness of this mitigation measure cannot be guaranteed at this time. The impact would remain significant and unavoidable.

AQ-b: Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is nonattainment under an applicable federal or state ambient air quality standard?

Less than Significant Impacts with Mitigation. The air quality analysis used California Emissions Estimator Model (CalEEMod) version 2016.3.2 to quantify criteria pollutant emissions from construction and operation of Alternative 4 (California Air Pollution Control Officers Association, 2016). Appendix D from the EIS presents details of the analysis inputs and calculation methods. Inclusion of air quality management practices into proposed construction and operational activities would reduce emissions. EIS Section 3.1.5.9 presents the air quality construction and operational management practices proposed for Alternative 4. The analysis quantified the effects of the following construction management practices:

- AQ MGMT-1. Fugitive Dust Control Plan, which would reduce fugitive dust emissions generated from the use of construction equipment on exposed soil by at least 55 percent from uncontrolled levels.
- AQ MGMT-3. Implementation of U.S. Environmental Protection Agency (USEPA) Nonroad Final Tier 4 emission standards, which would reduce emissions on average from the baseline fleet of off-road diesel-powered construction equipment greater than 50 horsepower.

The analysis quantified the effects of the following operational management practices:

- AQ MGMT-12. Implementation of USEPA Nonroad Final Tier 4 emission standards, which would reduce emissions on average from the baseline fleet of off-road diesel-powered operations equipment greater than 50 horsepower.
- AQ MGMT-14. The project would incorporate sustainable landscape design where feasible, including:

o Plant trees to provide shade and carbon dioxide (CO_2) absorption.
o Use drought-tolerant native vegetation.
o Reduce use of lawn types that require high levels of irrigation.
o Use high efficiency irrigation technology or recycled site water. CalEEMod assumed this measure would reduce outdoor water use by 6.1 percent. The effects of other parts of this measure were not quantified.
o Design buildings to capture and store rainwater for landscape irrigation.

Operational air quality management practices that propose vehicle trip reduction methods and implementation of transit, bicycle, and pedestrian measures (AQ MGMT-23 through AQ MGMT-30) were not directly quantified by the air quality analysis. However, the vehicle trip rates developed by the EIS traffic study and used in the air quality analysis included reductions to account for transit, bicycle, and pedestrian modes of travel and a mixed-use benefit. All other construction and operational management practices described in EIS Section 3.1.5.9 were not quantified due to model limitations and uncertainty in the degree of implementation.

Under Alternative 4, construction of the Navy facilities would occur from 2021 through 2025 on OTC Site 2. Full operation of the Navy facilities would begin in 2026. Construction of private development would occur from 2026 through 2049 on OTC Site 1 and OTC Site 2. Operation of private development would ramp up according to the sequence presented in EIS Table 3.1-9. Construction of the transit center would occur from 2026 through 2034. Operation of the transit center would begin in 2035. Because construction and operations would overlap beginning in 2026, the analysis determined the significance of the combined emissions of both activities starting in year 2026. The combined construction and operational emissions are presented in the operational emissions tables presented on the following pages.

Table 2.1-4 presents estimates of annual criteria pollutant emissions that would occur from construction of Alternative 4. For additional detail, Table 3.1-26 in EIS Section 3.1.5.7 shows the maximum annual construction emissions by source type. Application of architectural coatings would be the largest contributor to annual VOC emissions. Off-road construction equipment exhaust would be the largest contributor to annual NO_x, CO, and sulfur oxides (SO_x) emissions. Fugitive dust from demolition and the operation of equipment on bare soils would be the largest contributor to on-site annual suspended particulate matter less than or equal to 10 microns in diameter (PM_{10}) and fine particulate matter less than or equal to 2.5 microns in diameter ($PM_{2.5}$) emissions. Paved road dust from truck trips and worker vehicles would be the largest contributor to off-site annual PM_{10} and $PM_{2.5}$ emissions. Table 2.1-4 shows that the maximum annual construction emissions would be below the SDAPCD annual screening thresholds for all pollutants.

Table 2.1-5 presents estimates of maximum daily criteria pollutant emissions that would occur from construction of Alternative 4. For additional detail, Table 2.1-6 shows the maximum daily construction emissions by source type. Application of architectural coatings during construction of the private development would be the largest contributor to daily VOC emissions. Truck exhaust would be the largest contributor to daily NO_x and SO_x emissions. Off-road construction equipment exhaust would be the largest contributor to daily CO emissions. Fugitive dust from demolition and the movement of equipment on bare soils would be the largest contributor to on-site daily PM_{10} and $PM_{2.5}$ emissions. Road dust from worker trips and truck trips would be the largest contributor to off-site annual PM_{10} and $PM_{2.5}$ emissions.

Table 2.1-5 shows that the maximum daily construction emission of VOC would be above the SDAPCD daily screening threshold. The maximum daily construction emissions of all other criteria pollutants would be below the SDAPCD daily screening thresholds. Therefore, without mitigation, construction of Alternative 4 would result in a cumulatively considerable net increase of VOC emissions. VOC is a precursor to ozone, for which the region is nonattainment under both the state and national ambient air quality standards.

Table 2.1-4 Annual Construction Emissions, Alternative 4 (tons/year)

Year	*VOC*	*NO_x*	*CO*	*SO_x*	*PM_{10}*	*$PM_{2.5}$*

Exceeds Threshold?	**Yes**	**No**	**No**	**No**	**No**	**No**

Legend: VOC = volatile organic compounds; NO_x = nitrogen oxides; CO = carbon monoxide; SO_x = sulfur oxides; PM_{10} = particulate matter less than 10 microns in diameter; $PM_{2.5}$ = particulate matter less than 2.5 microns in diameter; SDAPCD = County of San Diego Air Pollution Control District.

Table 2.1-6 Maximum Daily Construction Emissions by Source Category, Alternative 4 (pounds per day)

Source Category	*VOC*	*NO_x*	*CO*	*SO_x*	*PM_{10}*	*$PM_{2.5}$*
Fugitive Dust	--[1]	--	--	--	29.4	7.7
Off-Road Equipment	6.2	30.4	228.7	0.4	0.9	0.9
Paving Off-Gas	3.5	--	--	--	--	--
Architectural Coating	1,191.3	--	--	--	--	--
Truck Trips	3.6	113.3	45.8	0.5	12.7	3.6
Worker Trips	10.7	5.7	63.7	0.2	33.0	8.8
All Source Categories[2]	**1,198.5**	**149.1**	**335.4**	**1.1**	**45.6**	**13.7**

Legend: VOC = volatile organic compounds; NO_x = nitrogen oxides; CO = carbon monoxide; SO_x = sulfur oxides; PM_{10} = particulate matter less than 10 microns in diameter; $PM_{2.5}$ = particulate matter less than 2.5 microns in diameter.

Notes: [1] Source type does not emit that pollutant.

[2] The individual source category emissions do not sum to equal the “All Source Categories” emissions because not all the emissions would occur on the same day.

Tables 2.1-7 and 2.1-8 present estimates of annual and maximum daily criteria pollutant emissions, respectively, that would occur from operation of Alternative 4 for each analysis year and the peak emissions year. Emissions in years prior to 2050 include concurrent construction emissions. The emissions in years 2035 and 2050 include the increases in transit center vehicle trips relative to 2020 existing conditions. The EIS Appendix D Tables D3.1-77, D3.1-81, and D3.1-82 present annual and maximum daily operational emissions by source category. Exhaust from vehicle trips generated by the Alternative 4 land uses would be the largest contributor to operational NO_x, CO, and SO_x emissions. Paved road dust from vehicle trips would be the largest contributor to operational PM_{10} and $PM_{2.5}$ emissions. Use of consumer products would be the largest contributor to operational VOC emissions.

Tables 2.1-7 and 2.1-8 show that annual and maximum daily criteria pollutant emissions would reach their peaks in 2048 and 2049, when construction would occur together with operation of the development near capacity. Emissions in the buildout year of 2050 would be less than the peak year emissions because there would be no construction in 2050. Operational emissions after 2050 would likely follow a gradually declining trend in response to the effects of future air quality regulations and technological innovations.

Table 2.1-7 compares the annual incremental emissions of Alternative 4 (i.e., Alternative 4 minus 2020 existing conditions) to the SDAPCD annual screening thresholds. These data show that the annual VOC increment would be above the threshold in 2035, the peak year of 2049, and 2050. The annual NO_x increment would be above the threshold in the peak year of 2048 and 2050. The annual PM_{10} increment would be above the threshold in 2035, the peak year of 2048, and 2050. The annual CO, SO_x, and $PM_{2.5}$ increments would be below the thresholds in all years.

Legend: VOC = volatile organic compounds; NO_x = nitrogen oxides; CO = carbon monoxide; SO_x = sulfur oxides; PM_{10} = particulate matter less than 10 microns in diameter; $PM_{2.5}$ = particulate matter less than 2.5 microns in diameter; CEQA = California Environmental Quality Act; SDAPCD = County of San Diego Air Pollution Control District.

Notes: [1] The CEQA baseline is OTC existing conditions (2020).
[2] Increment = Alternative minus CEQA Baseline.
[3] Assumes there would be no construction in 2050.
[4] Maximum emissions would occur in year 2049 for all pollutants.

Table 2.1-8 compares the maximum daily incremental emissions of Alternative 4 (i.e., Alternative 4 minus 2020 existing conditions) to the SDAPCD daily screening thresholds. These data show that the daily VOC increment would be above the threshold in 2030, 2035, the peak year of 2049, and 2050. The daily NO_x increment would be above the threshold only in the peak year of 2049. The daily PM_{10} increment would be above the threshold in 2035, the peak year of 2049, and 2050. The daily CO, SO_x, and $PM_{2.5}$ increments would be below the thresholds in all years.

In summary, Tables 2.1-7 and 2.1-8 show that operation of Alternative 4 would result in cumulatively considerable net increases of annual and daily VOC, NO_x, and PM_{10} emissions. VOC and NO_x are precursors to ozone, for which the region is nonattainment under both the state and national ambient air quality standards. The region is also nonattainment for PM_{10} under the state ambient air quality standards.

Mitigation Measures and Residual Impacts

As mentioned above, Alternative 4 would implement several management practices to minimize criteria pollutant emissions during construction (see EIS Section 3.1.5.9). For example, construction would proceed under a demolition plan and a fugitive dust plan. In addition, all off-road diesel-powered construction equipment greater than 50 horsepower would meet Tier 4 emission standards.

The high daily VOC emissions estimated for construction of Alternative 4 (see Tables 2.1-4 and 2.1-5) are a result of conservative default assumptions in CalEEMod. Specifically, CalEEMod assumed that all architectural coating activities over the entire 5-year construction period for Navy development would occur on only 20 work days. For private development, CalEEMod assumed all architectural coating activities over the entire 24-year construction period would occur on only 75 work days. The number of architectural coating work days assumed by CalEEMod is based on the number of acres developed rather than the building floor space constructed. For a high-density development project like Alternative 4, where there is a high ratio of building floor space to acres, the CalEEMod default assumption for work days is unrealistically low. Therefore, this analysis developed a mitigation measure to limit the daily amount of coating application such that the maximum daily construction VOC emissions from architectural coating and all other construction activities would remain just below the SDAPCD screening threshold of 137 pounds per day. This approach resulted in a daily limit of 119 pounds per day of VOC emissions from applied architectural coatings. This measure would effectively spread out the architectural coating activities over a much greater number of work days (a minimum of 54 Navy development work days and 751 private development work days) than the work days estimated by CalEEMod.

MM AQ-2. The contractor shall limit the quantity of architectural coatings applied during construction so that VOC emissions would not exceed 119 pounds per day in the applied coatings.

- At the current SDAPCD VOC limit of 50 grams per liter for general flat coatings (SDAPCD Rule 67.0.1 [Architectural Coatings] [SDAPCD, 2020]), this measure equates to a daily limit of 285 gallons of coatings per day.
- The daily limit for other coatings would be determined using the following formula: quantity of coating (gallons per day) = 285 x 50/(VOC content of other coatings in grams per liter).

For consistency between the NEPA and CEQA analyses, EIS Section 3.1.5.9 proposes MM AQ-2 as management practice AQ MGMT-5, even though it is not needed to reduce a significant impact under NEPA.

In addition to its mixed-use benefit and transit center, Alternative 4 incorporates several management practices to minimize operational criteria pollutant emissions. For example, the Navy would use on-site diesel warehouse equipment and standby generators that meet the cleanest Tier 4 emission standards. EIS Section 3.1.5.9 describes other air quality management practices that would help to minimize both criteria pollutant and GHG emissions during proposed operation. In addition, Section 3.2.3.9 of the EIS, *Transportation*, recommends the implementation of a transportation demand management (TDM) program to reduce vehicular traffic and associated emissions. Therefore, no additional measures are feasible to mitigate operational criteria pollutant emissions.

Table 2.1-9 presents estimates of maximum daily criteria pollutant emissions that would occur from construction of Alternative 4 with implementation of MM AQ-2. These data show that the maximum daily construction emissions would be reduced to below the SDAPCD daily screening threshold for VOC. The maximum daily construction emissions of all other criteria pollutants would remain below the SDAPCD daily screening thresholds. Therefore, construction of Alternative 4 with mitigation would result in less than significant criteria pollutant emission impacts.

Table 2.1-10 presents estimates of maximum daily criteria pollutant emissions that would occur from operation of Alternative 4 with application of MM AQ-2 to the concurrent construction emissions. These data show that the daily VOC increment would be reduced but would remain above the SDAPCD daily screening threshold in 2030, 2035, the peak year of 2049, and in 2050 and subsequent years. The daily NO_x increment would remain above the threshold in the peak year of 2049. The daily PM_{10} increment would remain above the threshold in 2035, the peak year of 2049, and in 2050 and subsequent years. The daily CO, SO_x, and $PM_{2.5}$ increments would remain below the thresholds in all years. Therefore, with implementation of MM AQ-2, operation of Alternative 4 would result in cumulatively considerable net increases of daily VOC, NO_x, and PM_{10} emissions.

Health Effects Related to Criteria Pollutant Emissions

In *Sierra Club v. County of Fresno* (2018), the California Supreme Court ruled that an EIR for a proposed master-planned, mixed-use development in Fresno County known as Friant Ranch did not adequately relate the expected adverse air quality impacts to likely health consequences or explain in meaningful detail why it is not feasible at the time of drafting to provide such an analysis. In response to the Court's decision, this section identifies the significant criteria pollutant emissions estimated for Alternative 4 and their possible associated health effects on the population within the ROI. The potential for adverse health effects is evaluated qualitatively by considering proposed emissions in context with the regional emissions and attainment status. The discussion does not identify any new impacts under CEQA, but rather provides additional information related to the significant emissions already identified above in Impact AQ-b.

Legend: VOC = volatile organic compounds; NO_x = nitrogen oxides; CO = carbon monoxide; SO_x = sulfur oxides; PM_{10} = particulate matter less than 10 microns in diameter; $PM_{2.5}$ = particulate matter less than 2.5 microns in diameter; CEQA = California Environmental Quality Act; SDAPCD = County of San Diego Air Pollution Control District.

Notes: (1) MM AQ-2 would limit the quantity of architectural coatings applied during construction so that VOC would not exceed 119 pounds per day in applied coatings.
(2) The CEQA baseline is OTC existing conditions (2020).
(3) Increment = Alternative minus CEQA Baseline.
(4) Assumes there would be no construction in 2050.
(5) Maximum emissions would occur in year 2049 for all pollutants.

Impact AQ-b concluded that Alternative 4 operations and overlapping construction and operations would produce significant emissions of VOC, NO_x, and PM_{10}. VOC and NO_x are precursors to ozone and PM_{10} and NO_x is also a precursor to nitrogen dioxide (NO_2). Therefore, this analysis evaluated the potential for adverse health effects resulting from the contributions of the alternative to regional ozone, NO_2, and PM_{10} concentrations.

Ozone. The SDAB is currently in nonattainment of the California Ambient Air Quality Standards (CAAQS) and National Ambient Air Quality Standards (NAAQS) for ozone. EIS Table 3.1-3 shows that during the 2017-2018 period, the Kearny Villa Road monitoring station recorded ozone concentrations that were 113 percent of the state 1-hour standard, 120 percent of the state 8-hour standard, and 103 percent of the 2015 federal 8-hour standard. Furthermore, Table 2.1-10 shows that construction and operation of Alternative 4 would increase VOC emissions by 368 pounds per day and NO_x emissions by 272 pounds per day in the maximum emissions year. These emissions are considered significant because they would exceed the SDAPCD significance thresholds. Therefore, because Alternative 4 would produce significant emissions of ozone precursors in a region that is nonattainment for ozone, this analysis concludes that Alternative 4 would contribute to adverse health effects associated with exposure to ozone in the region. Appendix D, Section 2 of this EIS describes the health effects associated with human exposure to ozone.

A comparison to EIS Table 3.1-2 shows that Alternative 4 would increase regional VOC and NO_x emissions by a maximum of about 0.2 percent. This suggests that the effect of Alternative 4 emissions on ozone-related health effects in the region would be slight relative to the region's overall ozone-related health effects.

NO_2. The SDAB is currently in attainment of the CAAQS and NAAQS for NO_2. EIS Table 3.1-3 shows that NO_2 concentrations recorded at the Beardsley Street or Kearny Villa Road monitoring station from 2016 through 2018 were no higher than 57 percent of its respective state or federal standard. Furthermore, as stated above in the discussion on ozone, Alternative 4 would increase regional NO_x emissions by a maximum of about 0.2 percent. Therefore, because of the region's attainment status and the relatively slight increase in regional NO_2 emissions associated with Alternative 4, this analysis concludes that Alternative 4 would not cause or contribute to an exceedance of an NO_2 standard in the region. As a result, Alternative 4 would not contribute to adverse health effects associated with exposure to NO_2.

PM_{10}. The SDAB is currently in nonattainment of the CAAQS for PM_{10}. EIS Table 3.1-3 shows that in 2016, the Beardsley Street monitoring station recorded a PM_{10} concentration that was 102 percent of the state 24-hour standard and the Chula Vista monitoring station recorded a PM_{10} concentration that was 109 percent of the state annual standard. Furthermore, Table 2.1-10 shows that construction and operation of Alternative 4 would increase PM_{10} emissions by 145 pounds per day in the maximum emissions year. This emission rate is considered significant because it would exceed the SDAPCD significance threshold. Therefore, because Alternative 4 would produce significant emissions of PM_{10} in a region that is nonattainment for PM_{10}, this analysis concludes that Alternative 4 would contribute to adverse health effects associated with exposure to PM_{10} in the region. Appendix D, Section 2 of this EIS describes the health effects associated with human exposure to PM_{10}.

A comparison to EIS Table 3.1-2 shows that Alternative 4 would increase regional PM_{10} emissions by a maximum of about 0.09 percent. This suggests that the effect of Alternative 4 emissions on PM_{10}-related health effects in the region would be slight relative to the region's overall PM_{10}-related health effects.

Limitations to Further Analysis

This analysis links criteria pollutant emissions estimated for Alternative 4 to potential health effects qualitatively because technical and scientific limitations prevent the accurate quantification of health effects. Modeling tools presently exist that could theoretically estimate health effects for ozone and PM_{10}. They include, for example, the Community Multiscale Air Quality Modeling System, Comprehensive Air Quality Model with Extensions, and Environmental Benefits Mapping and Analysis Program (USEPA, 2019a, 2019b; Ramboll Environ, 2019). However, both the South Coast Air Quality Management District (SCAQMD) and San Joaquin Valley Air Pollution Control District (SJVAPCD) filed *amicus curiae* briefs with the California Supreme Court for the Friant Ranch case claiming that currently available regional modeling tools are not well suited to analyze relatively small changes in pollutant concentrations associated with individual projects (SCAQMD, 2015; SJVAPCD, 2015). Regional modeling tools are generally designed to be used at the national, state, regional, and/or city levels. They are not equipped to analyze whether and to what extent the criteria pollutant emissions of an individual CEQA project directly impact human health in a particular area (SJVAPCD, 2015). For example, running a photochemical grid model used for predicting ozone attainment with the emissions solely from an individual project is not likely to yield valid information given the relative scale involved (SJVAPCD, 2015). SCAQMD stated that it does not currently know of a way to accurately quantify ozone-related health impacts caused by NO_x or VOC emissions from relatively small projects. The primary author of the California Air Resources Board (CARB) methodology for particulate matter mortality has reported that this methodology is not suited for small projects and may yield unreliable results due to various uncertainties (CARB, 2010; SCAQMD, 2015).

SCAQMD's own modeling shows that it takes a large amount of additional precursor emissions to cause a modeled increase in ambient ozone levels over an entire region and that it may only be feasible to analyze air quality-related health impacts for projects on a regional scale with very high emissions of NO_x and VOC. For example, SCAQMD's 2012 Air Quality Management Plan showed that reducing NO_x and VOC by 864,000 pounds per day and 374,000 pounds per day, respectively, would reduce ozone levels at the SCAQMD's monitor site with the highest levels by only 9 parts per billion. In another example, for its proposed Rule 1315, SCAQMD modeled approximately 89,180 pounds per day of VOC and 6,620 pounds per day of NO_x and predicted 20 premature deaths per year and 89,947 school absences per year due to the associated ambient ozone and PM exposures (SCAQMD, 2015). By comparison, Table 2.1-10 shows that the maximum VOC emissions from Alternative 4 would increase by 368 pounds per day (0.4 percent of the emissions evaluated for Rule 1315), and NO_x emissions would increase by 272 pounds per day (4 percent of the emissions evaluated for Rule 1315).

Notwithstanding these concerns expressed by the SCAQMD and SJVAPCD, the Sacramento Metropolitan Air Quality Management District (SMAQMD) published draft project-level Friant Ranch guidance in 2020 that provides screening emission thresholds specific to the Sacramento area and an approach for quantifying health effects using Comprehensive Air Quality Model with Extensions, Community Multiscale Air Quality Modeling System, or Environmental Benefits Mapping and Analysis Program (SMAQMD, 2020). In addition, there have been recent attempts at quantifying health effects for individual CEQA projects. For example, San Diego State University produced a report in December 2019 that estimated the health effects related to criteria pollutant emissions associated with the Mission Valley Campus Master Plan EIR (San Diego State University, 2019). The study used both the Comprehensive Air Quality Model with Extensions and Environmental Benefits Mapping and Analysis Program to model Mission Valley project emissions of 314 pounds per day of Reactive Organic Gas (essentially equivalent to VOC), 1,121 pounds per day of NO_x, and 206 pounds per day of $PM_{2.5}$. The study estimated that the health effects related to exposure to ozone and $PM_{2.5}$ would be negligible compared to background incidences. Specifically, for all the health endpoints quantified, the number of estimated incidences would be less than 0.004 percent of the background health incidence. The "background health incidence" is the actual incidence of health effects as measured in the local population in the absence of additional emissions from the Mission Valley project. In addition, the San Diego State University study acknowledged that the results may be overstated because the study "presumes that effects seen at large concentration differences can be linearly scaled down to (i.e., correspond to) small increases in concentration, with no consideration of potential thresholds below which health effects may not occur", and "health effects presented in this report are conservatively estimated, and the actual effects may be zero."

AQ-c: Expose sensitive receptors to substantial pollutant concentrations?

Potentially Significant Impacts.

HRA of Construction DPM Emissions

Construction of Alternative 4 would produce an estimated 3,271 pounds of on-site DPM emissions over the 29-year construction period (see Table D-35 of the EIS Appendix D). CARB has designated DPM as a TAC. Under California Office of Environmental Health Hazard Assessment risk assessment guidance, DPM is used as a surrogate for the complex mixture of chemicals that make up whole diesel exhaust. DPM is the main driver of cancer risk from construction equipment. Therefore, this analysis performed an HRA of DPM emissions associated with construction-related equipment and trucks operating on-site during construction of Alternatives 4 and 5. The HRA was prepared in accordance with guidance from the Office of Environmental Health Hazard Assessment and the SDAPCD (Office of Environmental Health Hazard Assessment, 2015; SDAPCD, 2019).

The HRA quantified the following types of health impacts:

- Individual cancer risk, which is the additional chance for a person to contract cancer after long-term (multiple year) exposure to project TAC emissions.
- Population cancer burden, which is the expected number of additional cancer cases within the project's zone of impact. The zone of impact is defined as the geographical area where the project's 70-year individual lifetime cancer risk is equal to or greater than one chance in a million.
- The chronic hazard index, which is a ratio of long-term TAC exposures to TAC reference exposure levels. A chronic hazard index below 1.0 indicates that adverse noncancer health effects on a particular human organ system (target organ) from long-term exposure are not expected.

The HRA results are summarized here. Appendix D from the EIS contains the full HRA report.

The HRA performed air dispersion modeling using the USEPA AERMOD dispersion model (USEPA, 2019c) with meteorological data from the San Diego International Airport. The Hot Spots Analysis & Reporting Program (CARB, 2019) estimated the health risks using the AERMOD output. The HRA quantified health risks to off-site receptor points classified as residential, worker, and nonresidential sensitive. Sensitive receptors represent locations where persons especially susceptible to adverse health effects from TACs (i.e., children, the elderly, and the ill) would be expected to congregate. They include schools (grades

Kindergarten through 12), day care centers, nursing homes, retirement homes, health clinics, and hospitals.

Table 2.1-11 presents the maximum predicted health impacts from construction of Alternative 4. The table includes estimates of individual cancer risk and chronic noncancer hazard index at the maximally exposed off-site residential, worker, and sensitive receptors.

Table 2.1-11 Summary of Health Risk Impacts from Construction of Alternative 4

Receptor Type	*Maximum Cancer Risk (chances in a million)*	*Maximum Chronic Noncancer Hazard Index*
Residential	12.5	0.004
Worker	8.8	0.03
Sensitive	12.7	0.03
Significance Threshold	**10**	**1.0**
Exceeds Threshold?	**Yes**	**No**

The maximum estimated cancer risk to a residential receptor from Alternative 4 construction would be 12.5 chances in a million. This value exceeds the significance threshold of 10 chances in a million. The estimated cancer risk conservatively assumed a 30-year residential exposure starting in the third trimester before birth and continuing to age 30.

The maximum estimated cancer risk to an off-site worker from Alternative 4 construction would be 8.8 chances in a million. This value is less than the significance threshold of 10 chances in a million. The estimated cancer risk at that location conservatively assumed a 25-year adult worker exposure, where the worker's schedule would match the OTC construction schedule.

The maximum estimated cancer risk to a sensitive receptor from Alternative 4 construction would be 12.7 chances in a million. This value exceeds the significance threshold of 10 chances in a million. The maximum sensitive receptor location is at the Veteran's Village of San Diego, located at 4141 Pacific Highway. The estimated cancer risk at that location conservatively assumed a 2¼-year residential exposure starting in the third trimester before birth and continuing to age 2. The modeled receptor was conservatively positioned near the edge of the Veteran's Village property closest to OTC.

The maximum estimated chronic noncancer hazard indices from Alternative 4 construction would be 0.004, 0.03, and 0.03 at a residential, worker, and sensitive receptor, respectively. These hazard indices are well below the significance threshold of 1.0. Therefore, this HRA predicted that no adverse noncancer health effects associated with long-term exposure to Alternative 4 construction emissions would occur.

Table 2.1-12 presents the estimated population cancer burden associated with Alternative 4 construction. The value of 0.013 additional cancer cases within the zone of impact is well below the significance threshold of 1.0.

Table 2.1-12 Population Cancer Burden from Construction of Alternative 4

Cancer Burden (additional cancer cases)	*Significance Threshold*	*Exceeds Threshold?*
0.013	1.0	No

Although management practices proposed for Alternative 4 would minimize construction DPM emissions and their associated health risks (see EIS Section 3.1.5.9), the analysis concluded that the resulting cancer risks from Alternative 4 construction emissions would be significant for the maximally exposed residential and sensitive receptors.

Potential Exposure to Operational TAC Emissions

Operation of the Navy facilities under Alternative 4 would include two diesel standby generators and three forklifts to support warehouse operations. The EIS Appendix D Table D3.1-96 shows that the standby generators would produce approximately 0.0001 ton of DPM emissions per year. The EIS Appendix D Table D3.1-98 shows that the forklifts (one of which would be diesel) would produce approximately 0.0003 ton of DPM emissions per year. Over a 30-year residential exposure period, these emissions would amount to approximately 0.012 tons, or 24 pounds of DPM. This is less than 1 percent of the DPM emissions modeled in the construction HRA for Alternative 4. Therefore, operation of the Navy facilities under Alternative 4 would not expose sensitive receptors to substantial levels of TACs.

Alternative 4 would also include the development of residential and commercial land uses. Residential land uses do not typically generate substantial TAC emissions. Commercial land uses could potentially include stationary sources of TACs such as dry-cleaning establishments or emergency standby generators. Because the description of Alternative 4 does not identify specific commercial facilities that would be sources of TACs, the analysis did not evaluate TAC emissions from this land use type. However, stationary sources of emissions associated with this alternative would be subject to SDAPCD Rules and Regulations that limit TAC emissions and establish operating permit requirements. In addition, management practices proposed for Alternative 4 would minimize TAC emissions during operations (see EIS Section 3.1.5.9). Therefore, TAC emissions associated with the operation of Alternative 4 would result in less than significant health impacts to sensitive receptors.

CO Hot Spots

EIS Section 3.1.5.7 evaluated the potential for vehicle trips generated from Alternative 4 to contribute to CO hot spots near local intersections. A CO hot spot would be considered significant if the CO concentration near a project-affected intersection would exceed the state's 1-hour ambient air quality standard of 20 parts per million or the state and federal 8-hour standard of 9.0 parts per million. The analysis used screening guidance, published by the SMAQMD, which finds that a project would not produce a significant local CO impact if it would not increase traffic volumes at affected intersections to more than 31,600 vehicles per hour (SMAQMD, 2016). Under Alternative 4, the project traffic study (see Appendix E from the EIS) estimated that the intersection of Rosecrans Street and Sports Arena Boulevard would have the greatest peak hour traffic volume of all signalized study intersections. With the inclusion of traffic generated from Alternative 4, the p.m. peak hour traffic volume would be 8,323 vehicles per hour. This volume is only 26 percent of the SMAQMD's screening threshold of 31,600 vehicles per hour. Therefore, operation of Alternative 4 would result in less than significant local CO impacts.

Impact of Nearby Sources on Future OTC Residents

This analysis also considered the potential for future OTC residents to be exposed to TAC emissions from the Interstate 5 freeway and adjacent businesses. CARB's *Air Quality and Land Use Handbook: A Community Health Perspective* recommends that development projects (1) avoid siting new sensitive land uses within 500 feet of a freeway, urban roads with 100,000 vehicles per day, or rural roads with 50,000 vehicles per day; (2) avoid siting new sensitive land uses within 300 feet of any dry-cleaning operation; and (3) avoid siting new sensitive land uses within 300 feet of a large gas station (3.6 million gallons per year or greater) or within 50 feet of a typical gas station (CARB, 2005).

Because more than one-half of OTC Site 1 is within 500 feet of Interstate 5, strict adherence to the first CARB recommendation is not feasible for Alternative 4. However, CARB notes that its recommendations are advisory and should not be interpreted as defined buffer zones, and that projects must balance other considerations such as transportation needs, the benefits of urban infill, community economic development priorities, and other quality-of-life issues. Consistent with the goals of CARB's handbook, Alternative 4 would support infill, mixed-use, higher density, and transit-oriented development that would benefit regional air quality. Additionally, the operational design measures for Alternative 4 (see EIS Section 3.1.5.9) would minimize exposure of OTC residents to TACs. Therefore, existing emission sources near OTC would not expose future Alternative 4 residents to substantial pollutant concentrations.

Hazardous Materials Associated with Project Demolition

Special hazardous wastes, including asbestos-containing materials, lead-based paint, PCBs, and mercury-containing devices (e.g., old switches, thermostats), would be generated during demolition activities under Alternative 4. EIS Section 3.7.3 addresses the methods that would prevent these hazardous materials from becoming airborne during demolition. In addition, construction of Alternative 4 would implement a demolition plan, as proposed in EIS management practice AQ MGMT-2. With appropriate protocols in accordance with applicable regulations, handling and disposal of hazardous materials would not result in contaminant releases or exposures of humans to harmful substances. As a result, demolition activities from Alternative 4 would result in less than significant impacts from TACs.

Mitigation Measures and Residual Impacts

Alternative 4 would implement the following management practices that would help to minimize DPM emissions and associated cancer risk related to the use of off-road construction equipment (see EIS Section 3.1.5.9):

- AQ MGMT-3 would require all off-road diesel-powered construction equipment greater than 50 horsepower to meet the Tier 4 emission standards.
- AQ MGMT-4 would impose a 5-minute idling limit on diesel construction equipment.
- AQ MGMT-6 would require the contractor to properly maintain and tune construction equipment.
- AQ MGMT-7 would encourage the construction contractor to consider using alternative-fueled and electric-powered construction equipment where practical.

No additional mitigation to reduce construction DPM emissions is feasible. As a result, cancer risks from Alternative 4 construction emissions would be significant.

AQ-d: Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?

The occurrence and severity of odor impacts depends on numerous factors including the nature, frequency, and intensity of the source; wind speed and direction; and the presence of sensitive receptors. While offensive odors rarely cause any physical harm, they still can be unpleasant, leading to distress and generating citizen complaints to local governments and regulatory agencies.

Construction

Less than Significant Impacts. Emissions from equipment and trucks in the form of diesel exhaust and VOCs from architectural coatings and paving activities would represent potential sources of odors from construction of Alternative 4. The offensiveness of odors from these types of sources are relatively minor in comparison to more offensive sources, such as decomposing biomass (hydrogen sulfide emissions) or chemical processing facilities. Additionally, odors from architectural coatings and paving activities would cease upon drying or hardening. Due to their temporary and intermittent nature, odor emissions transported off site would dilute to below levels of concern at any sensitive receptor site.

Implementation of the management practices identified under Impact Criterion AQ-c would minimize odors of diesel exhaust from construction of Alternative 4. Implementation of AQ MGMT-8, which would direct the construction contractor to select low-emitting construction materials, also would help to minimize odors from construction. As a result, odor emissions from construction of Alternative 4 would not affect a substantial number of people and therefore would be less than significant.

Operations

Less than Significant Impacts. Alternative 4 would develop residential, commercial, retail, office, hotel, transit, park, and open space land uses in proximity to one another. While the development specifics are currently unknown, planned land uses are not expected to generate substantial amounts of odors. A typical commercial land use proposed for development that would generate odors would be restaurants. Odors associated with proposed restaurants or other commercial uses would be similar to existing residential and food service uses throughout the Midway-Pacific Highway Community area and therefore would not generally be considered adverse. In addition, Alternative 4 includes management practices, such as AQ MGMT-12 (use of Tier 4 emission standards on operational equipment) and AQ MGMT-31 (use of alternative-fueled or electric-powered operational equipment), that would help to minimize odor generation. As a result, operation of Alternative 4 would not create objectionable odors affecting a substantial number of people.

This analysis also considered the potential for future OTC residents to be exposed to odors from adjacent businesses. Auto body shops and gas stations are two existing land uses in the immediate vicinity of OTC that could be sources of odors to future residents. These sources would be required to comply with SDAPCD Rule 51 (Nuisance), which prohibits the discharge of air contaminants or other materials that would be a nuisance or annoyance to the public. Potential odors would also be controlled and minimized through compliance with the city's "Air Contaminant Regulations" (San Diego Municipal Code Section 142.0710). In addition, management practice AQ MGMT-16 would direct the Navy to consider adjacent air pollution sources such as gas stations, dry cleaners, and auto body shops in the siting, design, and construction of residential development. Therefore, odor impacts from existing land uses to OTC residents proposed under Alternative 4 would be less than significant.

Mitigation Measures and Residual Impacts

Impacts would be less than significant. Therefore, mitigation is not required. However, implementation of MM AQ-2 under Impact Criterion AQ-b, which would limit the amount of VOC emissions from the use of architectural coatings during construction of Alternative 4, would also minimize odor emissions from this source.

GHG-a: Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Less than Significant Impacts. Table 2.1-13 presents estimates of annual GHG emissions that would occur from construction and operation of Alternative 4 by analysis year. The emissions in years 2035 and 2050 include the increases in transit center vehicle trips relative to 2020 existing conditions. The EIS Appendix D Table D3.1-54 presents GHG emissions by source category for Alternative 4. Vehicle exhaust from trips generated by the development land uses would be the largest contributor to the carbon dioxide equivalent (CO_2e) emissions. For each analysis year, Table 2.1-13 shows the annual incremental emissions of Alternative 4 (i.e., Alternative 4 minus 2020 existing conditions). The highest emission increment of 46,830 metric tons per year of CO_2e would occur in the buildout year of 2050 then would slightly lower in future years as existing and future state GHG regulations reduce emissions from proposed sources. A comparison to EIS Tables 3.1-4 and 3.1-5 shows that this incremental increase would represent approximately 0.01 percent and 0.36 percent of the existing California and City of San Diego CO_2e emissions, respectively.

Table 2.1-13 Annual Construction and Operational GHG Emissions, Alternative 4

Source Category	***CO_2e* (MT/yr)**
Year 2026	
Construction[1]	5,138
Operation	8,338
Total	13,476
CEQA Baseline[2]	12,482
Alternative 4 Increment[3]	**993**
Year 2030	
Construction	5,138
Operation	22,265
Total	27,403
CEQA Baseline	12,482
Alternative 4 Increment	**14,921**
Year 2035	
Construction	5,138
Operation	32,075
Total	37,213
CEQA Baseline	12,482
Alternative 4 Increment	**24,731**
Year 2050	
Construction	5,138
Operation	54,174
Total	59,312
CEQA Baseline	12,482
Alternative 4 Increment	**46,830**

Legend: CO_2e = carbon dioxide equivalent; MT/yr = metric tons per year; CEQA = California Environmental Quality Act.

Notes: (1) Construction emissions are amortized over 30 years.
(2) The CEQA baseline is OTC existing conditions (2020).
(3) Increment = Alternative minus CEQA Baseline.

As discussed above in Section 2.1.1.1 (Significance Criteria), neither the SDAPCD nor the City of San Diego have adopted mass emission thresholds for GHG emissions under CEQA. Therefore, this analysis evaluates the significance of GHG impacts by determining consistency of Alternative 4 with the City of San Diego CAP, as presented in the following evaluation of Impact Criterion GHG-b.

GHG-b: Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Less than Significant Impacts.

2017 Climate Change Scoping Plan (2017 Scoping Plan)

The 2017 Scoping Plan requires CARB and other state agencies to adopt regulations and incentives to reduce GHG emissions to the levels specified in Executive Order S-3-05 and Executive Order B-30-15. As such, the 2017 Scoping Plan is not directly applicable to individual projects, although there are several regulatory measures aimed at the identification and reduction of GHG emissions. Most of these regulatory measures focus on area source emissions (e.g., energy usage, high-global warming-potential GHGs in consumer products), and vehicle emissions (e.g., more fuel-efficient vehicles, reduced VMT, fuel economy).

In terms of minimizing area source emissions, Alternative 4 would be consistent with the 2017 Scoping Plan through incorporation of the following management practices:

AQ MGMT-8	Low-emitting building materials
AQ MGMT-9	Cool and/or green roofs
AQ MGMT-10	Leadership in Energy and Environmental Design (LEED) Silver certification
AQ MGMT-11	Solar energy
AQ MGMT-13	Refrigerant management plan
AQ MGMT-14	Sustainable landscapes
AQ MGMT-17	Low flow plumbing fixtures and appliances
AQ MGMT-18	No wood or gas fireplaces
AQ MGMT-19	Recycled or sustainable building materials
AQ MGMT-20	Natural and passive cooling
AQ MGMT-21	Innovative site design and building orientation

In terms of minimizing vehicle emissions, Alternative 4 would be consistent with the 2017 Scoping Plan by developing high-density, transit-supportive residential and nonresidential land uses served by an on-site transit center. Alternative 4 would also incorporate the following management practices to further minimize vehicle emissions:

AQ MGMT-22	Electric vehicle charging stations
AQ MGMT-23	Bicycle parking spaces
AQ MGMT-24	Bicycle network
AQ MGMT-25	Designated parking for low-emitting, fuel-efficient, and carpool-vanpool vehicles
AQ MGMT-26	Encourage discounted transit passes for residents
AQ MGMT-27	Pedestrian network
AQ MGMT-28	Navy inter-facility employee shuttle

The above management practices are fully described in the EIS Section 3.1.5.9. In addition, Section 3.2.3.9, *Transportation*, of the EIS recommends the implementation of a TDM program to reduce vehicular traffic and associated emissions.

To evaluate the gain in efficiency of vehicle use associated with Alternative 4, the project transportation study prepared an SB 743 analysis (see the EIS Appendix E, Section 26.2). The analysis estimated that Alternative 4 at 2050 buildout would generate vehicle trips that average 4.5 VMT per day per resident. This value is 69 percent lower than the 2050 regional average of 14.4 VMT per day per resident predicted by the SANDAG Regional Travel Model. The analysis also estimated that Alternative 4 at 2050 buildout would generate vehicle trips that average 11.1 VMT per day per employee. This value is 48 percent lower than the 2050 regional average of 21.2 VMT per day per employee predicted by the SANDAG Regional Travel Model. Therefore, the reduction in VMT per service population for Alternative 4 is consistent with the 2017 Scoping Plan.

In summary, Alternative 4 would develop high-density, transit-supportive residential and nonresidential land uses served by an on-site transit center and would further enhance other multimodal options by designing the site to encourage pedestrian and bicycle connectivity. The Alternative would allow the City of San Diego to accommodate existing and projected population and employment growth within a developed, urbanized area, thereby avoiding the conversion of undeveloped land to developed uses, which also is consistent with CARB's objectives in the 2017 Scoping Plan. Therefore, Alternative 4 would not conflict with the 2017 Scoping Plan or the statewide emissions reduction targets for 2030 and 2050.

San Diego Forward: The Regional Plan

SANDAG's Regional Plan (the current RTP/Sustainable Communities Strategy for the region) contains five basic strategies to move the region toward sustainability. Of those, the two strategies focus on achieving GHG emission reductions:

- Focus housing and job growth in urbanized areas where there is existing and planned transportation infrastructure, including transit; and
- Invest in a transportation network that gives people transportation choices and reduces GHG emissions.

Alternative 4 is consistent with the Regional Plan's GHG emission reduction strategies because it would co-locate housing, employment, and a transit center in an urbanized area. Transit choices would include Amtrak, the North County Transit District COASTER, San Diego Metropolitan Transit System trolley, and numerous Metropolitan Transit System bus lines. Alternative 4 would provide further enhancements to the transit system by developing and improving bicycle and pedestrian networks and related amenities within the project site and connecting the networks to those in adjacent communities. In addition, Section 3.2.3.9 of the EIS, *Transportation*, recommends the implementation of a TDM program to reduce vehicular traffic and associated emissions. Therefore, Alternative 4 would not conflict with the GHG reduction strategies of SANDAG's San Diego Forward Regional Plan.

City of San Diego CAP

To evaluate the potential for Alternative 4 to conflict with the CAP, this analysis followed the CAP Consistency Checklist, the purpose of which is to "provide a streamlined review process for proposed new development projects that are subject to discretionary review and trigger environmental review" under CEQA (City of San Diego, 2017). The CAP Checklist "contains measures that are required to be implemented on a project-by-project basis to ensure that the specified emissions targets identified in the CAP are achieved. … Projects that are consistent with the CAP as determined through the use of this Checklist may rely on the CAP for the cumulative impacts analysis of GHG emissions." The CAP Consistency Checklist includes evaluation of the following three steps.

Step 1 (Land Use Consistency) of the CAP Checklist evaluates a project's consistency with the growth projections used in the development of the CAP. To not conflict with the CAP, a project would need to satisfy one of three possible land use options. Alternative 4 satisfies Option B, which describes a project that is not consistent with the existing land use plan and zoning designations but would increase density within a Transit Priority Area (TPA) and would implement the CAP Strategy 3 actions in Step 3 (see below). The city defines a TPA as an area within 0.5 mile of a major transit stop that is existing or planned (City of San Diego, 2019a). Because Alternative 4 would include a transit center, all project development would be within a TPA.

Step 2 (CAP Strategies Consistency) of the CAP Checklist includes seven items that check for consistency with CAP GHG emission reduction Strategy 1 (energy and water efficient buildings) and Strategy 3 (bicycling, walking, transit, and land use). The seven items cover (1) cool/green roofs, (2) plumbing fixtures and fittings, (3) electric vehicle charging, (4) bicycle parking spaces, (5) shower facilities, (6) designated parking spaces, and (7) TDM. While site-specific planning details are unknown at this time, Alternative 4 would satisfy these seven items by implementing management practices during project design and operation, as described in EIS Section 3.1.5.9, and TRANS MGMT-1, as described in EIS Section 3.2. Specifically, AQ MGMT-9 would satisfy Item 1 by providing cool and/or green roofs. AQ MGMT-17 would satisfy Item 2 by installing low flow plumbing fixtures and appliances in nonresidential and residential buildings. AQ MGMT-22 would satisfy Item 3 by providing electric vehicle charging stations for both residential and nonresidential uses in quantities specified by the CAP. AQ MGMT-23 would satisfy Item 4 by providing more short- and long-term bicycle parking spaces than required in the city's Municipal Code for each nonresidential use. AQ MGMT-29 would satisfy Item 5 by installing shower and changing facilities in nonresidential buildings consistent with voluntary measures under the California Green Building Code. AQ MGMT-25 would satisfy Item 6 by providing designated parking for low-emitting, fuel-efficient, and carpool-vanpool vehicles for nonresidential uses. Section 3.2.3.9 of the EIS, *Transportation*, recommends the implementation of a TDM program to reduce vehicular traffic and associated emissions, which would satisfy Item 7.

As determined in Step 1 above, Alternative 4 would not be consistent with the existing land use plan and zoning designations, but it would result in an increased density within the surrounding TPA. Therefore, Step 3 of the CAP Checklist establishes whether such a project would be consistent with the assumptions in the CAP by determining if it would implement the CAP Strategy 3 actions included in Step 3. The six Step 3 questions and their responses are as follows:

> *1. Would the proposed project implement the General Plan's City of Villages strategy in an identified TPA that will result in an increase in the capacity for transit-supportive residential and/or employment densities?*
>
> Yes. The city defines a "village" as the mixed-use heart of a community where residential, commercial, employment, and civic uses are all present and integrated. The City of Villages strategy focuses growth into mixed-use activity centers that are pedestrian-friendly districts linked to an improved regional transit system. The strategy is designed to sustain the long-term economic, environmental, and social health of the city and its many communities (City of San Diego, 2008a).
>
> OTC Site 1 is the primary land area within the Kurtz District, which the Community Plan has designated as an employment area with military, office, research and development, and complementary residential uses to support and complement the NAVWAR functions. OTC Site 2

is within the Dutch Flats Urban Village, which is planned as an employment and residential-focused urban village (City of San Diego, 2018). See EIS Section 3.4, *Land Use*, for a more detailed discussion of the features of these two planning areas. Under existing conditions, all but the easternmost portions of the Kurtz District and Dutch Flats Village are within a TPA (the exception being the area roughly east of Enterprise Street, including the southeast portion of OTC Site 1). By consolidating the Old Town Transit Center to OTC Site 1, Alternative 4 would extend the TPA to cover the currently excluded portions of the Kurtz District and Dutch Flats Village.

Alternative 4 would provide a transit-oriented mixed-use, high-density development within the Kurtz District and Dutch Flats Urban Village. The development would include transit-supportive residential, hotel, and employment uses close to the consolidated transit center on OTC. Specifically, Alternative 4 would construct 10,000 new residential units, 450 new hotel rooms, 1.6 million square feet of new private office and retail space, and 1.1 million square feet of government office, laboratory, and warehouse space within 0.5 mile of the consolidated transit center. The traffic study estimated that the mixed-use benefit of Alternative 4 would result in 6,663 avoided daily trips.

2. Would the proposed project implement the General Plan's Mobility Element in TPAs to increase the use of transit?

Yes. The General Plan's Mobility Element promotes the City of Villages strategy by calling for villages, employment centers, and other higher intensity uses to be located in areas that can be served by high-quality transit services. Alternative 4 would feature a transit center that provides access to Amtrak, the COASTER, the trolley, and numerous Metropolitan Transit System bus lines. All development would be within 0.5 miles of the consolidated transit center on OTC. Management practice AQ MGMT-30 would design transit stops to provide convenient access to future residents and workers. AQ MGMT-26 would encourage new multi-family residential uses to provide discounted transit passes to residents. Section 3.2.3.9 of the EIS, *Transportation*, recommends the implementation of a TDM program that would increase the use of transit. Furthermore, the project transportation study recommended an evaluation of the feasibility of providing transit signal priority along four roadway segments near OTC. The transportation study also recommended preparation of a transit mobility plan for the Proposed Action Alternatives to maximize the efficiency and attractiveness of transit for future employees and residents.

3. Would the proposed project implement pedestrian improvements in TPAs to increase walking opportunities?

Yes. Alternative 4 would implement management practice AQ MGMT-27, which would design the project to include a complete, functional, and interconnected pedestrian network. Because project-level planning details are unknown at this time, the specific pedestrian amenities have not been finalized. However, the project transportation study recommended 14 improvements within 0.5-mile walking distance from the OTC to enhance pedestrian accessibility to adjacent communities. The transportation study also recommended preparation of a pedestrian master plan for the Proposed Action Alternatives to guide design and implementation of policies and programs to enhance access and mobility around and within the site for pedestrians of all ages and abilities (see the EIS Appendix E, Section 19.4).

4. Would the proposed project implement the City of San Diego's Bicycle Master Plan to increase bicycling opportunities?

Yes. The goals of the *City of San Diego Bicycle Master Plan* are to (1) make bicycling a viable travel choice, particularly for trips of less than 5 miles; (2) provide a safe and comprehensive local and regional bikeway network; and (3) produce environmental quality, public health, recreation, and mobility benefits through increased bicycling (City of San Diego, 2013). Alternative 4 would implement management practice AQ MGMT-24, which would design the project to include dedicated bicycle lanes that connect to other communities and to the regional bicycle network. Because project-level planning details are unknown at this time, the specific bicycle amenities have not been finalized. However, the transportation study recommended 12 improvements within 0.5-mile bicycling distance from the OTC to enhance off-site bicycle network connectivity and improve safety. The transportation study also recommended preparation of a bicycle master plan for the Proposed Action Alternatives to guide design and implementation of policies and programs to enhance access and mobility around and within the site for bicyclists of all ages and abilities (see the EIS Appendix E, Section 20.0, *Bicycle Mobility*).

5. Would the proposed project incorporate implementation mechanisms that support transit-oriented development?

Yes. Alternative 4 would construct 10,000 new residential units, 450 new hotel rooms, 1.6 million square feet of new private office and retail space, 1.1 million square feet of government office, laboratory, and warehouse space, and 18 acres of parkland, all within a TPA that is served by the San Diego Trolley, Amtrak, COASTER, and numerous bus lines. As described above in the responses to Questions 1 through 4, Alternative 4 would include transit, pedestrian, and bicycle improvements to encourage alternative modes of transportation. Section 3.2.3.9 of the EIS, *Transportation*, recommends the implementation of a TDM program that would increase the use of transit.

6. Would the proposed project implement the Urban Forest Management Plan to increase urban tree canopy coverage?

Yes. One of the primary goals of the city's *Urban Forestry Program* is to increase the city's urban tree canopy cover and maximize the benefits of trees. The CAP set targets of 15 percent urban tree canopy coverage by 2020 and 35 percent by 2035. Alternative 4 would support the city's goals by planting trees throughout its development. Major streets and pathways within the project site would include trees and other natural amenities to provide shade and create a more inviting pedestrian environment. At this time, it is unknown if Alternative 4 would satisfy the specific CAP targets for tree canopy coverage. However, management practice AQ MGMT-14 would incorporate sustainable landscapes into the project design, including tree planting, use of drought-tolerant native vegetation, and use of high efficiency irrigation technology.

In summary, Steps 1 and 3 of the CAP Checklist determined that Alternative 4 would result in increased density within a TPA and implement CAP Strategy 3 actions. Step 2 of the CAP Checklist determined that Alternative 4 would be consistent with all applicable strategies and actions of the CAP. Therefore, Alternative 4 would not conflict with the CAP, and the project's incremental contribution to cumulative GHG emissions would be less than cumulatively considerable.

City of San Diego General Plan

The General Plan land use element establishes a City of Villages strategy to focus growth into mixed-use activity centers that are pedestrian-friendly, centers of community, and linked to the regional transit system. Implementation of this strategy can decrease VMT and reduce GHG emissions. As discussed above in the City of San Diego CAP section, Alternative 4 would support the type of mixed-use development envisioned by the City of Villages strategy. Alternative 4 would also incorporate numerous management practices to conform the project with specific applicable policies of the General Plan (see EIS Section 3.1.5.9). As a result, Alternative 4 would be consistent with the following key GHG-related policies of the General Plan:

Sustainable development: CE-A.5, CE-A.6, CE-A.9, CE-A.10, CE-A.11, CE-A.12, CE-F.4.
Sustainable energy: CE-I.4, CE-I.5.
Walkable communities: ME-A.6, ME-A.7, ME-A.8.
Transit: ME-B.3, ME-I.3, ME-I.4.
Street system: ME-C.3.
TDM program: CE-F.6, ME-E.1, ME-E.2, ME-E.3, ME-E.4, ME-E.6.
Bicycling: ME-F.2, ME-F.4.
Parking management: ME-G.5.

In summary, Alternative 4 would support General Plan concepts such as increased walkability, enhanced pedestrian and bicycle networks, improved connections to transit, and sustainable development and green building practices. Alternative 4 would also promote environmentally conscious building practices and materials, increased energy and water efficiency, increased on-site energy generation, and reductions in waste generation. All these project attributes correspond with policies set out by the General Plan. Therefore, Alternative 4 would not conflict with the GHG reduction strategies of the City's General Plan.

Midway-Pacific Highway Community Plan

The Midway-Pacific Highway Community Plan was designed to reflect and implement the CAP and the GHG reduction recommendations of the General Plan. Its policies refine the City's General Plan policies with site-specific recommendations applicable to the Midway-Pacific Highway Community. Alternative 4 would incorporate numerous management practices that would enable it to conform to specific applicable policies of the Community Plan (see EIS Section 3.1.5.9). As a result, Alternative 4 would be consistent with the following key GHG-related policies of the Community Plan:

Fireplace prohibition in Dutch Flats: SDR-15
Walkability: ME-2.1.
Bicycling: ME-3.1, ME-3.2.
Transit: ME-4.1, ME-4.3, ME-4.7.
Electric vehicle infrastructure: ME-6.3.
TDM program: ME-7.1, ME-7.2, ME-7.4, ME-7.5, ME-7.6, ME-7.8, ME-7.10.
Landscaping: UD-3.3, UD-3.5, UD-3.13
Sustainable development: UD-6.6, UD-8.2, UD-8.3, UD-8.4, UD-8.5, UD-8.6, UD-8.8, UD-8.9, UD-8.10, UD-8.11
Conservation: CE-1.1, CE-1.2, CE-1.4, CE-1.5, CE-1.6, CE-1.7, CE-1.8, CE-1.9

As previously shown in Table 2.1-3, Alternative 4 by itself would consume most the residential growth forecasted in the Community Plan, and it would exceed the employment growth forecasted in the Community Plan by a wide margin. Therefore, Alternative 4 is not consistent with the growth assumptions in the Community Plan. However, Alternative 4 would support the type of mixed-use development envisioned by the City of Villages strategy. The City of Villages strategy is designed to focus redevelopment, infill, and new growth into pedestrian-friendly, mixed-use activity centers linked to the regional transit system. Further, increasing residential density and nonresidential intensity along the transit corridors within TPAs would support the city in achieving its GHG emissions reduction targets under the CAP. As explained in the city's Final Program EIR for the Mission Valley Community Plan Update, "Concentrating new growth in an area can result in greater GHG emissions than allowing the less intensive land uses to remain since growth is being directed toward areas that would produce less GHG emissions per capita citywide. Thus, consistency with the City of Villages strategy can result in one Community Plan area having an increase in GHG emissions, with the result still being an overall decrease in citywide GHG emissions." (City of San Diego, 2019b).

In summary, Alternative 4 would be consistent with the City of Villages strategy and the GHG-related policies of the Community Plan. Therefore, Alternative 4 would not conflict with the GHG reduction strategies of the Community Plan.

Summary

Although Alternative 4 would increase GHG emissions relative to existing conditions at OTC, accommodating California's growing population base at this location and with the design attributes of the alternative is more efficient than other scenarios, such as development in a non-urbanized area without transit. As explained in the City's General Plan (City of San Diego, 2008a):

> The City of Villages strategy to direct compact growth in limited areas that are served by transit is, in itself, a conservation strategy. Compact, transit-served growth is an efficient use of urban land that reduces the need to develop outlying areas and creates an urban form where walking, bicycling, and transit are more attractive alternatives to automobile travel. Reducing dependence on automobiles reduces VMT which, in turn, lowers greenhouse gas emissions.

Further, as discussed above, Alternative 4 would not conflict with the GHG reduction strategies of CARB's Climate Change Scoping Plan, SANDAG's Regional Plan, the city's CAP, the City's General Plan, or the city's Midway-Pacific Highway Community Plan. Various factors support these determinations, such as mixed-use development proposed in an urban location served by transit, and incorporation of management practices that are consistent with these plans and go beyond existing regulatory compliance standards for the built environment. Therefore, Alternative 4 would not conflict with an applicable plan, policy or regulation adopted for the purpose of reducing emissions of GHGs. As a result, GHG emissions associated with construction and operation of Alternative 4 also would be less than significant in regard to Impact Criterion GHG-a.

Mitigation Measures and Residual Impacts

Impacts would be less than significant. Mitigation is not required.

2.1.1.4 Alternative 5 Impacts

AQ-a: Conflict with or obstruct implementation of the applicable air quality plan?

Potentially Significant Impacts.

Consistency with the RAQS

At the individual level, Alternative 5 would be within the residential growth projections, but above the employment and commercial growth projections for the Midway-Pacific Highway Community. At the cumulative level, Alternative 5, in conjunction with other proposed residential and mixed-use projects, would most likely exceed the residential growth projections for the Midway-Pacific Highway Community. Therefore, Alternative 5—both individually and in combination with other projects considered in the cumulative setting—would generate vehicular emissions that exceed the levels estimated in the RAQS. As a result, Alternative 5 would conflict with implementation of the RAQS and could have a potentially significant impact on regional air quality.

Consistency with the State Implementation Plan

With respect to the NAAQS, EIS Section 3.1.5.8 demonstrated that VOC and NO_x emissions associated with construction and operation of Alternative 5 would be less than the applicable General Conformity *de minimis* thresholds. Therefore, Alternative 5 would not conflict with or obstruct implementation of the SIP.

Mitigation Measures and Residual Impacts

MM AQ-1 would reduce significant impacts of Alternative 5 by requiring the Navy to provide the information needed to update the RAQS. However, as updates to the air quality plans are within the SDAPCD's jurisdiction, the effectiveness of this mitigation measure cannot be guaranteed at this time. The impact would remain significant and unavoidable.

AQ-b: Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is nonattainment under an applicable federal or state ambient air quality standard?

Less than Significant Impacts with Mitigation. Table 2.1-14 presents estimates of annual criteria pollutant emissions that would occur from construction of Alternative 5. The analysis quantified the effects of the same construction management practices as those evaluated for Alternative 4. The table shows that the maximum annual construction emissions would be below the SDAPCD annual screening thresholds for all pollutants.

Table 2.1-15 presents estimates of maximum daily criteria pollutant emissions that would occur from construction of Alternative 5. These data show that the maximum daily construction emission of VOC would be above the SDAPCD daily screening threshold. The maximum daily construction emissions of all other criteria pollutants would be below the SDAPCD daily screening thresholds. Therefore, without mitigation, construction of Alternative 5 would result in a cumulatively considerable net increase of VOC emissions.

Table 2.1-14 Annual Construction Emissions, Alternative 5 (tons/year)

Year	*VOC*	*NO_x*	*CO*	*SO_x*	*PM_{10}*	*$PM_{2.5}$*

2049	948.5	43.9	158.8	0.4	13.8	4.0
Maximum Daily Emissions	**948.5**	**126.7**	**288.3**	**1.0**	**41.1**	**12.4**
SDAPCD Threshold	137	250	550	250	100	67
Exceeds Threshold?	**Yes**	**No**	**No**	**No**	**No**	**No**

Legend: VOC = volatile organic compounds; NO_x = nitrogen oxides; CO = carbon monoxide; SO_x = sulfur oxides; PM_{10} = particulate matter less than 10 microns in diameter; $PM_{2.5}$ = particulate matter less than 2.5 microns in diameter; SDAPCD = County of San Diego Air Pollution Control District.

Tables 2.1-16 and 2.1-17 present estimates of annual and maximum daily criteria pollutant emissions, respectively, that would occur from operation of Alternative 5 for each analysis year and the peak emissions year. Emissions in years prior to 2050 include concurrent construction emissions. Table 2.1-16 shows that the annual VOC increment would be above the threshold in 2035, the peak year of 2049, and in 2050. Also, the annual PM_{10} increment would be above the threshold in the peak year of 2048 and 2050. Table 2.1-17 shows that the daily VOC increment would be above the threshold in 2030, 2035, the peak year of 2049, and in 2050. In addition, the daily PM_{10} increment would be above the threshold in the peak year of 2049 and in 2050. In summary, operation of Alternative 5 without mitigation would result in cumulatively considerable net increases of annual and daily VOC and PM_{10} emissions.

Mitigation Measures and Residual Impacts

Table 2.1-18 presents estimates of maximum daily criteria pollutant emissions that would occur from construction of Alternative 5 with implementation of MM AQ-2. These data show that the maximum daily construction emission of VOC would be reduced to below the SDAPCD daily screening threshold. The maximum daily construction emissions of all other criteria pollutants would remain below the SDAPCD daily screening thresholds. Therefore, construction of Alternative 5 with mitigation would result in less than significant criteria pollutant emission impacts.

Table 2.1-19 presents estimates of maximum daily criteria pollutant emissions that would occur from operation of Alternative 5 with application of MM AQ-2 to the concurrent construction emissions.

These data show that the daily VOC increment would be reduced but would remain above the SDAPCD daily screening threshold in 2030, 2035, the peak year of 2049, and in 2050 and subsequent years. The daily PM_{10} increment would also remain above the threshold in the peak year of 2049 and in 2050 and subsequent years. The daily CO, NO_x, SO_x, and $PM_{2.5}$ increments would remain below the thresholds. Therefore, with implementation of MM AQ-2, operation of Alternative 5 would result in cumulatively considerable net increases of daily VOC and PM_{10} emissions.

Health Effects Related to Criteria Pollutant Emissions

Because Alternative 5 would produce significant emissions of VOC and PM_{10} in a region that is nonattainment for ozone and PM_{10}, this analysis concludes that Alternative 5 would contribute to adverse health effects associated with exposure to ozone and PM_{10} in the region. The contribution of Alternative 5 to adverse health effects would be less than those of Alternative 4 and therefore slight, relative to the region’s overall ozone- and PM_{10}-related health effects.

Table 2.1-16 Annual Operational Emissions, Alternative 5 (tons per year)

(3) Assumes there would be no construction in 2050.
(4) Maximum emissions would occur in year 2049 for all pollutants.

Table 2.1-18 Maximum Daily Construction Emissions, Alternative 5 with Mitigation (pounds per day)

Year	*VOC*	*NO_x*	*CO*	*SO_x*	*PM_{10}*	*$PM_{2.5}$*
2021	15.1	122.8	197.2	0.7	29.7	9.4
2022	10.7	21.1	127.1	0.3	19.3	5.5

Legend: VOC = volatile organic compounds; NO_x = nitrogen oxides; CO = carbon monoxide; SO_x = sulfur oxides; PM_{10} = particulate matter less than 10 microns in diameter; $PM_{2.5}$ = particulate matter less than 2.5 microns in diameter; CEQA = California Environmental Quality Act; SDAPCD = County of San Diego Air Pollution Control District.

Notes: (1) Mitigation Measure AQ-2 would limit the quantity of architectural coatings applied during construction so that VOC would not exceed 119 pounds per day in the applied coatings.
(2) The CEQA baseline is OTC existing conditions (2020).
(3) Increment = Alternative minus CEQA Baseline.
(4) Assumes there would be no construction in 2050.
(5) Maximum emissions would occur in year 2049 for all pollutants.

AQ-c: Expose sensitive receptors to substantial pollutant concentrations?

Potentially Significant Impacts.

HRA of Construction DPM Emissions

Table 2.1-20 presents the maximum predicted health impacts from construction of Alternative 5. The table includes estimates of individual cancer risk and chronic noncancer hazard index at the maximally exposed off-site residential, worker, and sensitive receptors.

Table 2.1-20 Summary of Health Risk Impacts from Construction of Alternative 5

Receptor Type	*Maximum Cancer Risk (chances in a million)*	*Maximum Chronic Noncancer Hazard Index*
Residential	9.7	0.003
Worker	8.2	0.03
Sensitive	9.9	0.03
Significance Threshold	**10**	**1.0**
Exceeds Threshold?	**No**	**No**

The maximum estimated cancer risks from Alternative 5 construction would be 9.7, 8.2, and 9.9 chances in a million at a residential, worker, and sensitive receptor, respectively. These values are less than the significance threshold of 10 chances in a million. The maximum estimated chronic noncancer hazard indices from Alternative 5 construction would be 0.003, 0.03, and 0.03 at a residential, worker, and sensitive receptor, respectively. These hazard indices are well below the significance threshold of 1.0.

Table 2.1-21 presents the estimated population cancer burden associated with Alternative 5 construction. The value of 0.011 additional cancer cases within the zone of impact is well below the significance threshold of 1.0.

Table 2.1-21 Population Cancer Burden from Construction of Alternative 5

Cancer Burden (additional cancer cases)	*Significance Threshold*	*Exceeds Threshold?*
0.011	1.0	No

The results of the HRA show that construction of Alternative 5 would not expose sensitive receptors to substantial levels of TACs.

Potential Exposure to Operational TAC Emissions

Operation of the Navy facilities under Alternative 5 would include the same amount of on-site diesel equipment as Alternative 4. Therefore, similar to Alternative 4, operation of the Navy facilities under Alternative 5 would not expose sensitive receptors to substantial levels of TACs.

Alternative 5 would also include the development of residential and commercial land uses. The development would be less intensive than Alternative 4. Therefore, similar to Alternative 4, TAC emissions associated with the operation of Alternative 5 would result in less than significant health impacts to sensitive receptors.

CO Hot Spots

Section 3.1.5.8 of the EIS concluded that operation of Alternative 5 would result in less than significant local CO impacts.

Impact of Nearby Sources on Future OTC Residents

The Alternative 5 land uses would be in similar locations as the Alternative 4 land uses. Therefore, similar to Alternative 4, existing emission sources near OTC would not expose future Alternative 5 residents to substantial pollutant concentrations.

Hazardous Materials Associated with Project Demolition

EIS Section 3.7.3 concluded that, with proper protocols in accordance with applicable regulations, handling and disposal of hazardous materials during demolition and construction would not result in contaminant releases or exposures of humans to harmful substances. In addition, construction of Alternative 5 would implement a demolition plan, as proposed in EIS management practice AQ MGMT-2. Impacts would be less than significant.

Mitigation Measures and Residual Impacts

No additional mitigation to reduce construction DPM emissions is feasible. As a result, cancer risks from Alternative 5 construction emissions would be potentially significant.

AQ-d: Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?

Implementation of management practices identified in EIS Section 3.1.5.9 would minimize odor impacts from construction and operation of Alternative 5. Emissions and resulting odor impacts from Alternative 5 would generally be less than those identified for Alternative 4. Therefore, construction and operation of Alternative 5 would not create objectionable odors affecting a substantial number of people. Similar to Alternative 4, odor impacts to future OTC residents under Alternative 5 from existing land uses would be less than significant.

Mitigation Measures and Residual Impacts

Impacts would be less than significant. Therefore, mitigation is not required. However, implementation of MM AQ-2 under Impact Criterion AQ-b, which would limit the daily amount of VOC emissions from the use of architectural coatings during construction of Alternative 5, also would minimize odor emissions from this source.

GHG-a: Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Table 2.1-22 presents estimates of annual GHG emissions that would occur from construction and operation of Alternative 5 by analysis year. As discussed above in Section 2.1.1.1 (Significance Criteria), neither the SDAPCD nor the City of San Diego have adopted mass emission thresholds for GHG emissions under CEQA. Therefore, this analysis evaluated the significance of Alternative 5 GHG impacts by determining the alternative’s consistency with the City of San Diego CAP in Significance Criterion GHG-b.

Table 2.1-22 Annual Construction and Operational GHG Emissions, Alternative 5

Source Category	*CO_2e (MT/yr)*
Year 2026	
Construction[1]	4,261
Operation	8,338
Total	12,598
CEQA Baseline[2]	12,482
Alternative 5 Increment[3]	**116**
Year 2030	
Construction	4,261
Operation	19,092
Total	23,353
CEQA Baseline	12,482
Alternative 5 Increment	**10,870**
Year 2035	
Construction	4,261
Operation	26,960
Total	31,220
CEQA Baseline	12,482
Alternative 5 Increment	**18,738**
Year 2050	
Construction	4,261
Operation	44,808
Total	49,069
CEQA Baseline	12,482
Alternative 5 Increment	**36,587**

Legend: CO_2e = carbon dioxide equivalent; MT/yr = metric tons per year; CEQA = California Environmental Quality Act.

Notes: [1] Construction emissions are amortized over 30 years.
[2] The CEQA baseline is OTC existing conditions (2020).
[3] Increment = Alternative minus CEQA Baseline.

GHG-b: Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Alternative 5 would develop high-density, transit-supportive residential and nonresidential land uses served by an on-site transit center and would further enhance other multimodal options by designing the site to encourage pedestrian- and bicycle-oriented connectivity. In addition, Alternative 5 would implement the same management practices as those identified for Alternative 4. Therefore, the GHG plan consistency findings for Alternative 4 would also apply to Alternative 5. As a result, Alternative 5 would not conflict with the 2017 Climate Change Scoping Plan, SANDAG's San Diego Forward Regional

Plan, the City of San Diego CAP, the City of San Diego General Plan, or the Midway-Pacific Highway Community Plan. This means that the incremental contribution of Alternative 5 to cumulative GHG emissions would be less than significant in regard to Impact Criterion GHG-a.

Mitigation Measures and Residual Impacts

Impacts would be less than significant. Mitigation is not required.

2.1.2 Cumulative Impacts

2.1.2.1 Description of Geographic Study Area

The ROI for assessing cumulative impacts from criteria pollutants and TACs generated by Alternative 4 or 5 includes the immediate area surrounding OTC and the larger SDAB region. The immediate area surrounding OTC is the focus of localized cumulative impacts from proposed construction and operations emissions. The SDAB domain is appropriate for evaluating how mass emissions from the action alternatives would affect cumulative levels of pollutants in the region.

The potential effects of GHG emissions generated by Alternatives 4 or 5 are by nature cumulative impacts because global sources of GHGs contribute to global climate change. Therefore, the ROI for the cumulative analysis of proposed GHG emissions is worldwide. These global impacts would be manifested as impacts on resources and ecosystems in California and San Diego County.

2.1.2.2 Relevant Past, Present, and Future Actions

EIS Section 3.1 describes the existing air quality conditions, which reflect the aggregate impacts of past and present actions within the ROI. For example, the SDAB is in attainment of all criteria pollutants regulated under the NAAQS except ozone. Additionally, the SDAB does not attain the CAAQS for ozone, PM_{10}, and $PM_{2.5}$. These conditions define how past and present actions currently affect air quality within the ROI and provide the context for the cumulative impacts analysis.

Past, present, and reasonably foreseeable actions that have a potential to interact with the Proposed Action Alternatives and to produce cumulative air quality impacts include existing and future sources of emissions in proximity to OTC and within the greater San Diego metropolitan area and the SDAB. Vehicular traffic on Interstate 5 and city streets surrounding OTC represent the primary sources of emissions within the localized ROI. EIS Table 4.3-2 lists past, present, and reasonably foreseeable actions with an air quality designation that could interact with the action alternatives to produce cumulative air quality impacts within either the localized or regional ROI.

2.1.2.3 Cumulative Impact Analysis

Cumulative air quality impacts from project Alternatives 4 or 5 are based on the net increase in emissions that would occur from an alternative relative to the 2020 existing conditions, in combination with emissions from cumulative projects. The analysis considered the cumulative effects of these emissions in regard to Impact Criteria AQ-a through AQ-d, GHG-a, and GHG-b, as identified in the Air Quality and Greenhouse Gases section of Appendix G of the CEQA Guidelines.

2.1.2.4 Alternatives 4 and 5

AQ-1: Conflict with or obstruct implementation of the applicable air quality plan?

The analysis of Impact AQ-a determined that operation of Alternative 4, in conjunction with other proposed residential and mixed-use projects, would most likely exceed the residential growth projections for the Midway-Pacific Highway Community. As a result, Alternative 4 would generate vehicular emissions that would exceed levels estimated in the RAQS and therefore would produce a cumulatively considerable contribution to a significant cumulative impact by conflicting with implementation of the RAQS. Implementation of MM AQ-1 potentially would reduce this significant impact by requiring the Navy to provide growth projections needed to update the RAQS. However, as updates to the air quality plans are within the jurisdiction of the SDAPCD, the effectiveness of this mitigation measure cannot be guaranteed at this time. Therefore, with mitigation, the impact of Alternative 4 under Criterion AQ-a would remain cumulatively considerable.

With respect to the NAAQS and SIP, EIS Section 3.1.5.7 demonstrated that VOC and NO_x emissions associated with construction and operation of Alternative 4 would be less than the General Conformity *de minimis* thresholds. Therefore, Alternative 4 would not conflict with or obstruct implementation of the SIP and would result in less than cumulatively considerable contributions related to Impact Criterion AQ-a.

The analysis of Impact AQ-a determined that operation of Alternative 5, in conjunction with other proposed residential and mixed-use projects, would most likely exceed the residential growth projections for the Midway-Pacific Highway Community. Therefore, with mitigation, the impact of Alternative 5 under Criterion AQ-a would remain cumulatively considerable. With respect to the NAAQS and SIP, EIS Section 3.1.5.8 demonstrated that VOC and NO_x emissions associated with construction and operation of Alternative 5 would be less than the General Conformity *de minimis* thresholds. Therefore, Alternative 5 would not conflict with or obstruct implementation of the SIP and would result in less than cumulatively considerable contributions related to Impact Criterion AQ-a.

AQ-b: Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is nonattainment under an applicable federal or state ambient air quality standard?

The SDAB is in nonattainment of the NAAQS for ozone and the CAAQS for ozone, PM_{10}, and $PM_{2.5}$. Levels of ozone, PM_{10}, and $PM_{2.5}$ within the ROI are therefore cumulatively significant. VOCs and NO_x are precursor emissions of ozone and particulate matter.

Construction of Alternative 4 without mitigation would result in emissions that would exceed the SDAPCD daily screening threshold for VOC. Emissions of all other pollutants would not exceed their respective SDAPCD emission threshold. Implementation of MM AQ-2 would reduce VOC emissions from construction to below the SDAPCD daily screening threshold. Therefore, emissions from construction of Alternative 4 with mitigation would result in less than cumulatively considerable contributions to cumulatively significant levels of ozone, PM_{10}, and $PM_{2.5}$.

Operation of Alternative 4 (plus concurrent construction) without mitigation would result in incremental emissions (Alternative 4 minus 2020 existing conditions) that would exceed the annual and daily SDAPCD screening thresholds for VOC, NO_x, and PM_{10} beginning as early as 2030 for daily VOC emissions. Emissions of all other pollutants would not exceed their respective SDAPCD emission thresholds. Implementation of MM AQ-2 would reduce VOC emissions from construction, but it would not reduce any of the operation plus construction emission exceedances to below their respective SDAPCD screening thresholds. With the implementation of proposed management practices, no additional measures are feasible to mitigate operational criteria pollutant emissions. Therefore, emissions from operation of Alternative 4 with mitigation would result in cumulatively considerable contributions to cumulatively significant levels of ozone, PM_{10}, and $PM_{2.5}$.

Construction of Alternative 5 without mitigation would result in emissions that would exceed the SDAPCD daily screening threshold for VOC. Emissions of all other pollutants would not exceed their respective SDAPCD emission threshold. Implementation of MM AQ-2 would reduce VOC emissions from construction to below the SDAPCD daily screening threshold. Therefore, emissions from construction of Alternative 5 with mitigation would result in less than cumulatively considerable contributions to cumulatively significant levels of ozone, PM_{10}, and $PM_{2.5}$.

Operation of Alternative 5 (plus concurrent construction) without mitigation would result in incremental emissions (Alternative 5 minus 2020 existing conditions) that would exceed the annual and daily SDAPCD screening thresholds for VOC and PM_{10} beginning as early as 2030 for daily VOC emissions. Emissions of all other pollutants would not exceed their respective SDAPCD emission thresholds. Implementation of MM AQ-2 would reduce VOC emissions from construction, but it would not reduce any of the operation plus construction emission exceedances to below their respective SDAPCD screening thresholds. With the implementation of proposed management practices, no additional measures are feasible to mitigate operational criteria pollutant emissions. Therefore, emissions from operation of Alternative 5 with mitigation would result in cumulatively considerable contributions to cumulatively significant levels of ozone, PM_{10}, and $PM_{2.5}$.

AQ-c: Expose sensitive receptors to substantial pollutant concentrations?

Localized Criteria Pollutant Levels

As discussed in EIS Section 4.4.1.3 (cumulative impacts), emissions from construction and operation of Alternative 4 or 5, in combination with emissions from nearby cumulative projects, would not be substantial enough to contribute to a localized exceedance of an ambient air quality standard. Therefore, Alternatives 4 or 5 would result in less than cumulatively considerable contributions to localized criteria pollutant levels.

Toxic Air Contaminants

Contributions from cumulative sources of TACs to localized off-site project impacts would occur from nearby stationary sources and from vehicles on Interstate 5 and city streets surrounding OTC. The background cancer risk from these sources is expected to be at least 100 chances in a million (SDAPCD, 2019). Therefore, the background cancer risk is cumulatively significant.

The analysis of Impact AQ-c determined that construction of Alternative 4 would generate TACs from on-site diesel equipment that would result in significant cancer risks to nearby sensitive receptors. When added to impacts from cumulative projects, construction of Alternative 4 would produce cumulatively considerable contributions to significant cumulative cancer risks adjacent to OTC. Proposed management practices would minimize construction diesel emissions and their associated health risks (see Section 3.1.5.9); however, the contribution would be cumulatively considerable.

The analysis of Impact AQ-c also determined that operation of Alternative 4 would generate TACs that would result in less than significant health impacts to sensitive receptors. Therefore, operation of Alternative 4 would produce less than cumulatively considerable contributions to cumulative cancer risks adjacent to OTC.

The analysis of Impact AQ-c determined that construction of Alternative 5 would result in cancer risks to nearby sensitive receptors that are just below the significance threshold (i.e., 9.9 chances in a million versus a significance threshold of 10). Therefore, when added to impacts from cumulative projects, construction of Alternative 5 would produce cumulatively considerable contributions to significant cumulative cancer risks adjacent to OTC. Proposed management practices would minimize construction diesel emissions and their associated health risks (see Section 3.1.9.3); however, the contribution would be cumulatively considerable.

The analysis of Impact AQ-c also determined that operation of Alternative 5 would generate TACs that would result in less than significant health impacts to sensitive receptors. Therefore, operation of Alternative 5 would produce less than cumulatively considerable contributions to cumulative cancer risks adjacent to OTC.

AQ-d: Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?

Sources of odors from cumulative projects in proximity to OTC mainly include stationary sources such as auto body shops, gas stations, and restaurants. Existing and future cumulative sources of odors would be required to comply with SDAPCD Rule 51 (Nuisance) and the city's "Air Contaminant Regulations" (San Diego Municipal Code Section 142.0710). Therefore, cumulative projects in proximity to OTC would result in less than significant cumulative impacts to odor levels.

The analysis of Impact AQ-d determined that construction and operation of Alternative 4 or 5 would not create objectionable odors affecting a substantial number of people. When added to odor impacts from cumulative projects, Alternative 4 or 5 would produce less than cumulatively considerable contributions to cumulative odor impacts adjacent to OTC. Implementation of management practices for the construction and operation of Alternative 4 or 5 would help to minimize odor generation (see Section 3.1.9.3).

Greenhouse Gases

The impact of proposed GHG emissions is inherently cumulative. Therefore, the analyses performed for impact criteria GHG-a and GHG-b are cumulative in nature. The results of these analyses determined that construction and operations of Alternative 4 or 5 would result in less than cumulatively considerable contributions to global GHG levels.

2.2 Transportation

A transportation system and the associated infrastructure by which it functions includes the public roadway network, various modes of public transportation, airports, railroads, pedestrian/bicycle facilities, and waterborne transportation modes required for the movement of people, materials, and goods. Implementation of a Proposed Action Alternative has the potential to affect the transportation infrastructure that provides access to and within the local area and network. Sections 3.2.1, 3.2.2, and 3.2.3 of the EIS present a description of the regulatory setting, environmental setting, and assessment methodology, respectively.

2.2.1 Impacts Determination

2.2.1.1 Impacts Summary

Table 2.2-1 presents a summary of impacts related to transportation for each criterion specified in CEQA Appendix G Environmental Checklist Form. Explanation of each impact conclusion is provided in the following subsections.

Table 2.2-1 Impacts Related to Transportation

Criteria	*Potentially Significant*	*Less than Significant with Mitigation*	*Less than Significant*	*No Impact*
XVII. Transportation (TRANS-) Would the project:	-	-	-	-
a) Conflict with a program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities?	-	-	**X**	-
b) Conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b)?	-	-	**X**	-
c) Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?	-	-	**X**	-
d) Result in inadequate emergency access?	-	-	**X**	-

Legend: - = no data in cell; X = selection for Alternatives 4 and 5.

Approach for the Determination of Significance

CEQA Statute Section 15064.3 states that traffic-related impacts for a project should be evaluated based on the project's VMT. The statute divides the analysis process into four subdivisions, including land use projects, transportation projects, qualitative analysis, and methodology. For transportation projects, VMT is calculated based on individual vehicle trips and their trip lengths.

According to the City of San Diego draft guidance, thresholds for significance for vehicle traffic are based on regional averages for VMT per unit (such as per capita or per employee). The guidance outlines four primary steps in the process. First, screening criteria are applied to determine whether VMT analysis is required. This process is governed by the CEQA guidelines. Next, an analysis methodology outlines the procedures for evaluating VMT for transportation projects. Finally, projects that are found to have a significant impact based on VMT thresholds are required to implement mitigation measures to reduce impacts to less than a significant level (to the extent feasible). In addition to the VMT analysis noted above, the city also requires a Local Mobility Analysis to identify any off-site infrastructure improvements in the project vicinity (including site access and circulation needs) that may be triggered with the development of the Proposed Action.

Significance criteria within local guidelines also apply to parking available and capacity. Under City of San Diego guidelines, if a proposed project would be deficient by more than 10 percent of the required amount of parking and would either substantially affect the availability of parking in an adjacent residential area or severely impede the accessibility of a public facility such as a park or beach, the impact would be considered significant.

2.2.1.2 No Action/No Project Alternative Impacts

TRANS-a: Conflict with a program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities?

No impact. Under the No Action Alternative, the Navy would continue to maintain and repair the existing facilities. NAVWAR would continue to operate at OTC and no change would occur. Therefore, there would be no traffic-related impact to local plans or policies from the No Action Alternative.

TRANS-b: Conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b)?

No impact. Given that the No Action Alternative would not add trips to the network, there would be no increase in VMT within the ROI and therefore no impact to the transportation facilities. There would be no impact based on CEQA guidelines for the No Action Alternative.

TRANS-c: Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?

No impact. The No Action Alternative would not implement any new transportation features. Thus, there would be no impact due to geometric changes to the network or other design features from implementation of the No Action Alternative. Crash data provides a general indication of geometric features that may contribute to existing levels of safety for facilities within the ROI. Evaluation of existing crash data shows no fatal crashes during a 5-year period, with 52 crashes during the same period on the ROI network near OTC. Nearly 50 percent of the crashes occurred along Pacific Highway between Kurtz Street and Witherby Street. Three crashes were classified as rear-end, and three were classified as hit object, which could also indicate crashes related to existing infrastructure features, especially intersections. The No Action Alternative would not result in project-related infrastructure changes, there would be no impact to the design of transportation facilities within the ROI.

TRANS-d: Result in inadequate emergency access?

No impact. Under the No Action Alternative, background traffic increases would alter operation of the transportation infrastructure within the ROI, but no trips would be added due to this alternative. Therefore, emergency access would remain the same under the No Action Alternative and there would be no impact to emergency access due to the No Action Alternative.

Given that existing OTC operations would not add additional VMT above baseline levels, the No Action Alternative would result in no impact on emergency access. The EIS Appendix E describes the baseline analysis of VMT for future conditions for comparison with Alternative 4 and 5.

2.2.1.3 Alternative 4 Impacts

TRANS-a: Conflict with a program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities?

Construction

Less than significant. Alternative 4 construction activities would not conflict with local community plans and airport development plans. Implementation of this alternative would require construction phasing and sequencing plans that would minimize the potential for transportation impacts, considering strategies such as off-peak material deliveries, lane closure restriction times, and staggered work schedules. Alternative 4 would potentially include development and implementation of a Transportation Management Plan that would identify potential issues and alleviate these through a variety of traffic control strategies, public information campaigns, and operational strategies.

Local plans also include considerations for transit, bicycle, and pedestrian facilities. Of critical importance for potential construction impacts is access to and availability of transit, bicycle, and pedestrian facilities, including accommodations and access during construction. Construction activities would be consistent with local ordinances and policies. The EIS Appendix E Section 23 provides a full overview of construction strategies and proposed methods to accommodate transportation system users during construction. Alternative 4 construction activities would result in less than significant impacts with regard to conflicts with existing plans and ordinances, and no mitigation measures are required.

Operations

Less than significant. The analysis of traffic-related impacts from Alternative 4 incorporates guidelines provided by the City of San Diego as well as the California Department of Transportation, and there are no conflicts with program, plans, ordinances, or policies addressing the circulation system. For Alternative 4, the addition of the transit center reduces what would otherwise be vehicle trips, and there would also be some induced demand for vehicle trips accessing the transit center. Alternative 4 operations would not significantly conflict with existing programs, plans, or policies related to transportation, impacts would be less than significant, and no mitigation measures would be required.

Mitigation Measures and Residual Impacts

No mitigation measures are required, as Alternative 4 would be consistent with programs, plans, and policies and less than significant impacts would occur as a result of implementation.

TRANS-b: Conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b)?

Construction

Less than significant. For future construction activities, designers would prepare, and contractors would implement a traffic control plan that accommodates users during construction. In addition, a Transportation Management Plan would outline strategies to alleviate short-term delays through strategies such as off-peak lane closures (the traffic control plan is one component of the Transportation Management Plan). Although Alternative 4 construction activities could contribute to temporary traffic delays in the immediate vicinity of OTC, this would not conflict with CEQA Guidelines section 15064.3, subdivision (b). Impacts would be less than significant and appropriately managed during construction.

Operations

Less than significant. The results of the VMT analysis show less than significant impacts when comparing VMT per resident to regional VMT averages and threshold values. This finding is based on the Proposed Action VMT per resident and VMT per employee being less than their respective significance thresholds. Table 2.2-2 includes the VMT comparison for Alternative 4 (see the EIS Appendix E Section 26 for additional detail).

Table 2.2-2 Alternative 4 VMT Per Resident and VMT Per Employee Regional Comparison

Proposed Action Alternative	*2050 Regional VMT Per Resident*	*Significance Threshold Per Resident*	*Proposed Action 2050 VMT Per Resident*	*2050 Regional VMT Per Employee*	*Significance Threshold Per Employee*	*Proposed Action 2050 VMT Per Employee*
Alternative 4	14.4	12.2	4.5	21.2	18.0	11.1

Under the VMT analysis in the EIS Appendix E (Sections 24 through 26), analysts screened projects to determine if they fit the criteria for further analysis, calculated metrics, and then compared them with averages for the region. SANDAG travel demand models calculated these metrics and reported the results similar to the analysis described earlier for each alternative. As outlined in the table above, the results of comparison to regional/threshold VMT are within CEQA thresholds for the Proposed Action Alternatives. The project would not exceed 15 percent below the existing regional or city VMT per capita or employee (the significance threshold per resident or per employee). Thus, Alternative 4 operations would be consistent with CEQA Guidelines section 15064.3, subdivision (b) and impacts would be less than significant.

Mitigation Measures and Residual Impacts

Since the VMT analysis shows no significant impacts, mitigation measures are not required to address compliance with CEQA Guidelines section 15064.3, subdivision (b).

TRANS-c: Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?

Construction

Less than significant. As an example of a major infrastructure modification, Caltrans has prepared a concept plan for reconstructing the Interstate 5/Old Town Avenue interchange. Construction activities for major projects such as the interchange reconstruction could impact traffic circulation, and efficient construction phasing would be determined in the future. Many of the plans and suggested mitigation strategies are conceptual at this stage, and detailed design would be performed in the future. However, considerations for adequate design features should be made in the future for implementation of any of the measures proposed. During construction, contractors and agency personnel can proactively monitor crash data, assess project inspection records, and perform field safety audits to ensure adequate levels of safety. There would be less than significant impacts from construction of Alternative 4.

Operations

Less than significant. Alternative 4 includes planning level data and information to assist with the assessment of development alternatives, and formal geometric design of roadways and intersections has not been initiated. Designers would consider the potential hazards and ensure that future geometric designs are adequate for appropriate levels of safety. Roadside hazards would be mitigated through the use of protective devices such as guardrail to prevent roadway departure crashes. There would be less than significant impacts from implementation of Alternative 4.

Mitigation Measures and Residual Impacts

Impacts from implementation of Alternative 4 are not significant under CEQA guidelines; therefore, no mitigation measures are required.

TRANS-d: Result in inadequate emergency access?

Construction

Less than significant. Alternative 4 construction activities would add trips to the ROI network, with the potential to reduce traffic flow within and around OTC. The project could potentially affect emergency access during construction due to capacity restriction and lane closures. The construction contractor would prepare and implement a traffic control plan that would ensure adequate accommodation for emergency access. Therefore, impacts from Alternative 4 would be less than significant.

Operations

Less than significant. Adequate access would be provided for emergency vehicles under this alternative. Strategies for emergency access include route planning and coordination between first responders on operational procedures. Implementation of Alternative 4 would be expected to have less than significant impacts to emergency access.

Mitigation Measures and Residual Impacts

Impacts from implementation of Alternative 4 would be less than significant under CEQA guidelines; therefore, no mitigation measures are required.

2.2.1.4 Alternative 5 Impacts

Less than significant with mitigation incorporated. Impacts from the buildout of Alternative 5 would be similar to those of Alternative 4 noted above, with varying levels of added trips on the ROI network. Based on the VMT analysis results, there would be less than significant impacts from implementation of Alternative 5, and no mitigation would be required. Table 2.2-3 includes the VMT comparison for Alternative 5 (see EIS Appendix E Section 26 for additional detail).

Table 2.2-3 Alternative 5 VMT Per Resident and VMT Per Employee Regional Comparison

Proposed Action Alternative	*2050 Regional VMT Per Resident*	*Significance Threshold Per Resident*	*Proposed Action 2050 VMT Per Resident*	*2050 Regional VMT Per Employee*	*Significance Threshold Per Employee*	*Proposed Action 2050 VMT Per Employee*
Alternative 5	14.4	12.2	5.3	21.2	18.0	11.5

2.2.2 Cumulative Impacts

A cumulative impact is an impact on the environment that results after adding the incremental impact of a Proposed Action to other past, present, and reasonably foreseeable future actions. The cumulative impacts analysis for transportation incorporates the affected environment, traffic growth in future years, and the alternatives with full buildout by 2050. The year 2050 also corresponds with the time horizon associated with many of the identified RTPs described in the EIS Table 4.3-1. EIS Table 4.3-2 identifies the cumulative projects considered in this analysis. As shown in EIS Table 4.3-2, the projects identified capture short-term construction traffic-related projects and long-term regional transportation improvement plans and programs. EIS Table 3.2-6 highlights no significant impacts to transportation in 2050 under the cumulative impact scenario and based on VMT analyses for the Proposed Action.

2.3 Aesthetics (Visual Resources)

Aesthetic or visual resources are the natural and manmade features of the landscape that can be seen and perceived by viewers and this viewing contributes to the public's perception and interaction with the environment. Visual or aesthetic resource impact studies must determine if the project's physical characteristics, potential visibility, and the extent that the project's presence would negatively (or positively) change the perceived visual character and quality of the environment. To ensure that potential changes to visual quality resulting from a project are adequately and objectively considered, it is critical that an accepted, systematic evaluation process be used.

In general terms, the visual environment is considered to be a vital component of an area's overall vibrancy and value. High visual quality areas generally have higher quality development, protected open space, and higher land values.

The ability of the landscape to undergo alteration without losing its visual character is considered important for the maintenance of high scenic value and cohesive neighborhood character. As development deviates from the natural landscape, visual impacts can increase, especially if the development pattern is incoherent, chaotic, or of poor design. The visual impacts of a project are determined by a number of factors, including effects on the visual character and quality (e.g., form, line, color, and texture), visual exposure, viewer sensitivity, and the number of viewers who are expected to see the project. In certain areas such as this one, views are also an important resource for a community.

A description of the area of visual effect (AVE), approach to analysis, regulatory setting, and affected environment are presented in Sections 3.3.1, 3.3.4.1, 3.3.2, and 3.3.3 the EIS, respectively.

2.3.1 Impacts Determination

2.3.1.1 Impacts Summary

Table 2.3-1 presents a summary of impacts related to aesthetics for each criterion specified in CEQA Appendix G Environmental Checklist Form. Explanation of each impact conclusion is provided in the following subsections.

Table 2.3-1 Impacts Related to Aesthetics

Criteria	*Potentially Significant*	*Less than Significant with Mitigation*	*Less than Significant*	*No Impact*
I. AESTHETICS (AES-) Would the project:	-	-	-	-
a) Have a substantial adverse effect on a scenic vista?	**X**	-	-	-
b) Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?	**X**	-	-	-
c) In nonurbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?	**X**	-	-	-
d) Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?	**X**	-	-	-

Legend: - = no data in cell; X = selection for Alternatives 4 and 5.

Approach for the Determination of Significance

Local agencies can expand upon or provide more guidance on the four thresholds of potential significant impact if adopted by local agencies. The City of San Diego (2016) has published additional CEQA significance determination for visual effects and neighborhood character, and the following will be evaluated:

Views (additional guidance on CEQA significance criteria AES-a):

Projects that would block public views from designated open space areas, roads, or parks or to significant visual landmarks or scenic vistas (Pacific Ocean, downtown skyline, mountains, canyons, waterways) may result in a significant impact. To meet this significance threshold, one or more of the following conditions must apply:

SD-a. The project would substantially block a view through a designated public view corridor as shown in an adopted community plan, the General Plan, or the Local Coastal Program.

SD-b. The project would cause substantial view blockage from a public viewing area of a public resource (such as the ocean) that is considered significant by the applicable community plan.

SD-c. The project exceeds the allowed height or bulk regulations, and this excess results in a substantial view blockage from a public viewing area.

SD-d. The project would have a cumulative effect by opening up a new area for development, which will ultimately cause "extensive" view blockage.

Neighborhood Character/Architecture (additional guidance on CEQA significance criteria AES-b and AES-c):

Projects that severely contrast with the surrounding neighborhood character. To meet this significance threshold, one or more of the following conditions must apply:

SD-e. The project exceeds the allowable height or bulk regulations and the height and bulk of the existing patterns of development in the vicinity of the project by a substantial margin.

SD-f. The project would have an architectural style or use building materials in stark contrast to adjacent development where the adjacent development follows a single or common architectural theme (e.g., Gaslamp Quarter, Old Town).

SD-g. The project would result in the physical loss, isolation or degradation of a community identification symbol or landmark (e.g., a stand of trees, coastal bluff, historic landmark) which is identified in the General Plan, applicable community plan or local coastal program.

SD-h. The project is located in a highly visible area (e.g., on a canyon edge, hilltop or adjacent to an interstate highway) and would strongly contrast with the surrounding development or natural topography through excessive height, bulk, signage, or architectural projections.

SD-i. The project would have a cumulative effect by opening up a new area for development or changing the overall character of the area (e.g., rural to urban, single-family to multi-family). As with views, cumulative neighborhood character effects are usually considered significant for a community plan analysis, but not necessarily for individual projects. Project-level mitigation should be identified at the community plan level. Analysts should also evaluate the potential for a project to initiate a cumulative effect by building structures that substantially differ from the character of the vicinity through height, bulk, scale, type of use, etc., when it is reasonably foreseeable that other such changes in neighborhood character will follow.

Note: Item SD-g (Loss of any distinctive or landmark tree or community identification symbol) is not carried forward in the impact analysis below, as it does not apply to the Proposed Action. Although the existing structures on OTC are eligible for listing in the National Register of Historic Places, they have not been designated as such. See Section 2.6 for an analysis of impacts to Cultural Resources. Although the size of the warehouse buildings on OTC dominate the overall visual character of the area, they are not considered to be positive visual resources or represent a landmark and the structures are not part of the identified General Plan or community plan or local coastal program.

Landform Form Alteration (additional guidance on CEQA significance criteria AES-b)

Substantial change in the existing landform? Projects that significantly alter the natural landform can result in a significant impact. To meet this significance threshold, typically the following conditions must apply:

SD-j. The project would alter more than 2,000 cubic yards of earth per graded acre by either excavation or fill. Grading of a smaller amount may still be considered significant in highly scenic or environmentally sensitive areas. Excavation for garages and basements are typically not held to this threshold.

SD-k. The project would disturb steep hillsides in excess of the encroachment allowances of the Environmentally Sensitive Lands regulations (Land Development Code Chapter 14, Article 3, Division 1).

SD-l. The project would create manufactured slopes higher than 10 feet or steeper than 2:1 (50 percent).

SD-m. The project would result in a change in elevation of steep hillsides as defined by the San Diego Municipal Code Section 113.0103 from existing grade to proposed grade of more than 5 feet by either excavation or fill, unless the area over which excavation or fill would exceed 5 feet is only at isolated points on the site.

Note: all Landform Form Alteration criteria (Items SD-j to SD-m) are not carried forward in the analysis below, as the Proposed Action occurs in an urban area that is already developed. Although grading would include more than 2,000 cubic yards, it would primarily be completed for the purposes of garages and basements. In addition, no existing landform is present on-site, nor would one be created as a result of this project.

Development Features (additional guidance on CEQA significance criteria AES-c)
Projects that have a negative visual appearance. To meet this significance threshold, one or more of the following conditions must apply:

SD-n. The project would create a disorganized appearance and would substantially conflict with city codes (e.g., a sign plan which proposes extensive signage beyond the city's sign ordinance allowance).

SD-o. The project significantly conflicts with the height, bulk, or coverage regulations of the zone and does not provide architectural interest (e.g., a tilt-up concrete building with no offsets or varying window treatment).

SD-p. The project would include a crib wall or retaining wall, or noise walls greater than 6 feet in height and 50 feet in length with minimal landscape screening or berming where the walls would be visible to the public.

SD-q. The project is large and would result in an exceeding monotonous visual environment (e.g., a large subdivision in which all the units are virtually identical).

SD-r. The project includes a shoreline protection device in a scenic, high public use area, unless the adjacent bluff areas are similarly protected.

Note: item SD-r is not included in the impact analysis for this project, as the Proposed Action is not located in the coastal zone, and therefore coastal structures do not apply to this project and therefore are dropped from any other discussion.

Light and Glare (additional guidance on CEQA significance criteria AES-d)
Substantial light or glare which would adversely affect daytime or nighttime view in the area from a project that emits or reflects a significant amount of light and glare. To meet this significance threshold, one or more of the following must apply:

SD-s. The project would be moderate to large in scale, more than 50 percent of any single elevation of a building's exterior is built with a material with a light reflectivity greater than 30 percent (see Land Development Code Section 142.07330(a)), and the project is adjacent to a major public roadway or public area.

SD-t. The project would shed substantial light onto adjacent, light-sensitive property or land use, or would emit a substantial amount of ambient light into the nighttime sky.

The impact analysis below relies on the in-depth visual technical study prepared for the EIS (see the EIS Appendix F) and refers to figures in the appendix, instead of duplicating the information in this section. The affected environment description for this analysis, including figures, is presented in Section 3.3.3 of the EIS.

2.3.1.2 No Action/No Project Alternative Impacts

By definition, the No Action Alternative would not result in any changes to the visual environment, and the current facilities and surface lots would remain on OTC in their current condition. The No Action Alternative would result in less than significant impacts to aesthetics.

2.3.1.3 Alternative 4 Impacts

The proposed development under Alternative 4 includes buildings up to 350 feet tall. Figure 2.3-1 shows a three-dimensional model of possible massing that would accommodate the program needs of this alternative. The construction on OTC would occur in phases over a 30-year period, with the NAVWAR facilities being constructed in the first 5 years, prior to the construction of the mixed-use development.

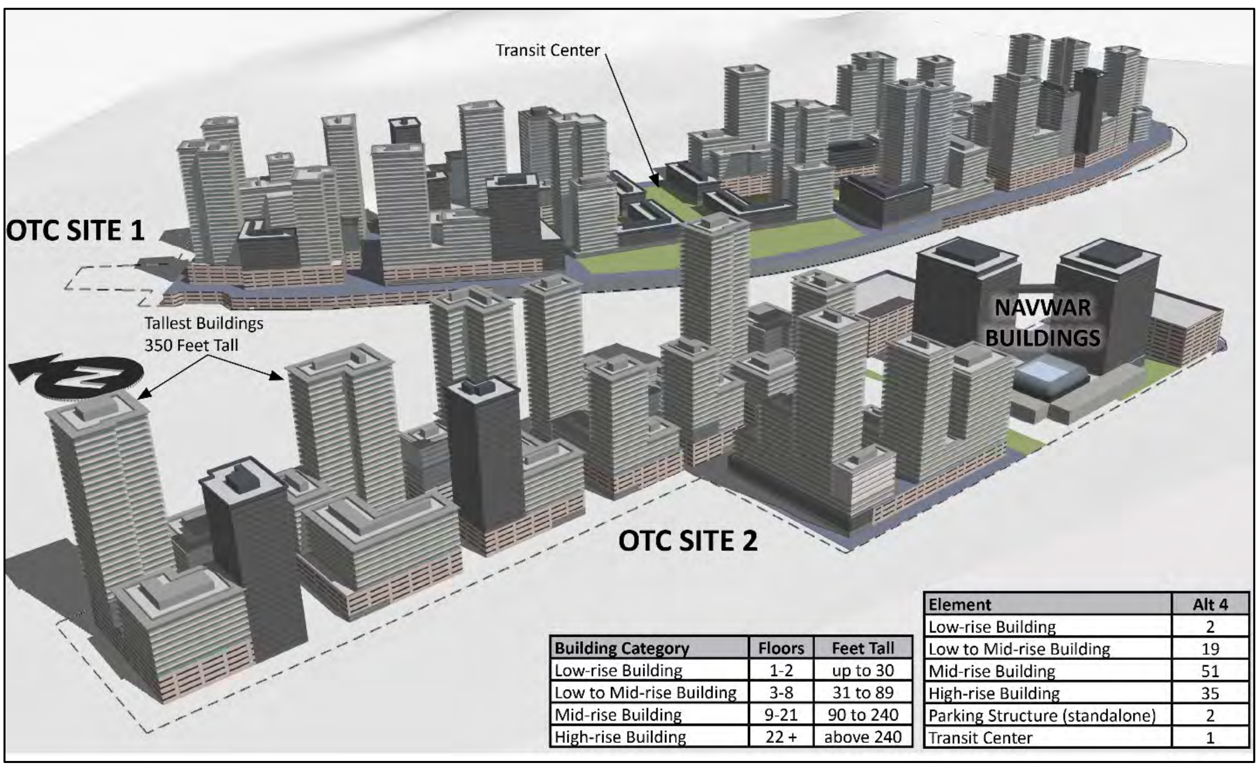

Figure 2.3-1 General Building Massing of Alternative 4

This diagram is not intended to show an actual architectural design nor to commit to any massing arrangement of these buildings other than indicating the general height, number of floors, and parking structures needed to represent the programmatic requirements of the alternatives. The diagram does show the major physical elements that would be likely to have a high level of visual prominence. The table presented on the diagram provides a summary of the major physical features of the alternative including floors, heights, and number of total buildings being considered. Simulations of the proposed development under Alternative 4 in the context of the existing visual setting from key observation points (KOPs) selected from within a 1-mile radius of OTC are presented in EIS Appendix F, Attachment B.

Of the 109 buildings shown in the massing diagram, 2 percent would be low rise below 30 feet, 19 percent would be low-to mid-rise from 31 to 89 feet, 47 percent would be mid-rise from 90 to 240 feet, and the remaining 32 percent would be high-rise buildings representing a height up to 350 feet tall. NAVWAR parking requirements would mostly be met by standalone parking. Standalone parking structures are considered low-to mid-rise buildings. Major parking lots and structures would be required to support the parking requirements needed for the total gross and net square feet of the building complex. In this alternative, much of the parking would be below a 30-foot-tall deck with much of the vehicular circulation and parking taking place below this deck and plazas, promenades, parks, and smaller streets on top of these decks. This alternative would also accommodate a major transit center and public spaces that would divide the OTC Site 1 into two separated complexes or grouping of buildings.

AES-a: Have a substantial adverse effect on a scenic vista?

Potentially significant impact. Structures that would be constructed under Alternative 4 would substantially block views both from private locations and various public locations including parks, open space, public realm spaces and from roadway rights-of-way. The proposed height and massing of the proposed buildings for all high-rise and mid-rise buildings would result in a substantial view blockage from many public viewing areas of regionally and sub-regionally important viewing scenes including the Pacific Ocean, Mission Bay, San Diego Bay, San Diego River, Cabrillo Point, and the Point Loma Peninsula. Additional detail is provided in the responses to the City of San Diego significance determination criteria below.

SD-a. Would Alternative 4 substantially block a view through a designated public view corridor as shown in an adopted community plan, the General Plan, or the Local Coastal Program? and

SD-b. Would the Alternative 4 result in a substantial view blockage from a public viewing area of a public resource (such as the ocean) that is considered significant by the applicable community plan?

Based on adopted plans and policies, the project would have the potential to block views of several viewing scenes generally identified in the General Plan or community plans. OTC is located within the City of San Diego's Midway-Pacific Highway Community Planning Area; however, OTC is federal property, and therefore the community does not have jurisdiction over its land use. The **Midway-Pacific Highway Community Plan** (City of San Diego, 2018) does not have any specific view corridors identified for protection within the Dutch Flats Urban Village section (where OTC is located). Policies in other planning documents in the surrounding area are summarized briefly here to provide context:

The General Plan (City of San Diego, 2013, 2015) provides policy guidance intended to balance the needs of a growing population while enhancing quality-of-life for current and future residents. The **Urban Design Element** of the General Plan includes the following guidance on views: **UD-A.3.** Design development adjacent to natural features must be done in a sensitive manner to highlight and complement the natural environment in areas designated for development. Protect views from public roadways and parklands to natural canyons, resource areas and scenic vistas. Preserve views and view corridors along and/or into waterfront areas from the public right-of-way by decreasing the heights of buildings as they approach the shoreline, where possible.

The **Mobility Element** of the General Plan includes the following guidance on views: Under the discussion of Street Layout, Design and Operations under the Mobility Element: The quality of our traveling experience is also influenced by the scenic quality of the area traversed. San Diego enjoys many scenic vistas of our coastline, canyons, and other open spaces. Scenic highways and routes provide an opportunity for people to experience these views while traveling through the city.

The **Uptown Community Plan** (City of San Diego, 2019c) includes the following guidance on views: The Uptown Community vision is to: Preserve existing views of undeveloped natural canyons and views of San Diego Bay, Downtown and Mission Valley from ridgelines is a high priority for the community.

The **Peninsula Community Plan** (City of San Diego, 2011) includes the following guidance on views: Dramatic ocean and downtown views are scattered throughout the community, creating a unique visual environment. Development objectives include protecting unique natural and manmade features, improving community entry points, and preserving and enhancing significant views of the bay and ocean.

Table 2.3-2 identifies 10 sub-regionally important viewing scenes that have the potential to be blocked by the proposed development on OTC under Alternative 4. These viewing scenes include coastline (bay and ocean), canyons and other natural areas, as well as developed scenic features such as the Downtown San Diego skyline. Alternative 4 would potentially block from 11 percent to 62 percent of the total views, with special concern for affected views of San Diego Bay, Coronado, Mission Bay, San Diego River, Cabrillo Point, and the Point Loma Hillside.

Table 2.3-2 Summary of Alternative 4 Viewing Scene Impacts

Viewing Scene(1)	*Percent of View Blocked*	*Persons (based on 2016 pop.) within the Viewshed Limits*	*Persons (based on 2016 pop.) Likely to see the Site*(2)	*Persons (based on 2035 pop.) within the Viewshed Limits*	*Persons (based on 2035 pop.) Likely to see the Site* (2)
1. San Diego River	61.89%	3,876	2,399	3,776	2,337
2. Mission Bay	37.93%	3,876	1,470	3,776	1,432
3. Mission Valley North	61.06%	2,143	1,309	2,314	1,413
4. Presidio/Mission Hills	32.26%	11,560	3,729	13,852	4,468
5. Pacific Ocean West	25.94%	4,220	1,095	3,874	1,005
6. Pacific Ocean Southwest	35.85%	2,550	914	1,994	715
7. San Diego Bay/Coronado	36.72%	6,038	2,217	6,782	2,490
8. Cabrillo	23.30%	4,927	1,148	4,538	1,058

Viewing Scene[(1)]	*Percent of View Blocked*	*Persons (based on 2016 pop.) within the Viewshed Limits*	*Persons (based on 2016 pop.) Likely to see the Site*[(2)]	*Persons (based on 2035 pop.) within the Viewshed Limits*	*Persons (based on 2035 pop.) Likely to see the Site* [(2)]
9. Pt Loma Hillside	44.16%	9,059	4,000	9,162	4,046
10. Downtown Skyline	11.73%	1,158	136	2,606	306
Average Percent of View Blocked[(1)]	37.08%	24,154[(3)]	8,957	25,528[(3)]	9,467

Legend: % = percent; Pop. = Population.

Notes: (1) Percent of view area affected is based upon a topographic model only and does not include existing buildings and structures.

(2) Persons affected were based on SANDAG Master Geographical Reference Areas estimates for 2016 and 2035. Calculations assumed even distribution across Master Geographical Reference Areas.

(3) Populations in the various viewing locations overlap. This number has taken out the double counting of persons.

Changes in view quality were further analyzed from 10 KOPs (refer to EIS Section 3.3.3, *Affected Environment*, for how these points were selected). A simulation of the proposed development was inserted into the photo from each KOP to analyze the degree of view blockage that would be anticipated at that location. Simulations showing views of the proposed development under Alternative 4 from all 10 KOPs are provided in EIS Appendix F, Attachment B. As shown below in Table 2.3-3, KOPs 2, 3, 4, 5, and 6 would experience less than significant (none to moderate adversity) view blockage under Alternative 4. Potentially significant impacts (moderately high and high adversity) would occur at KOPs 1, 7, 8, 9, and 10.

Table 2.3-3 Summary of Alternative 4 View Quality Impacts

Key Observation Point	*Viewing Blockage Expected*[(1)]	*Positioning of Blockage*[(1)]
KOP 1 (IN-1): Interstate 5 Southbound	Moderately High Adversity	Silhouette with the Sky
KOP 2 (PC-2): Pacific Coast Highway Northbound in South Midway Sub-Area	Moderate Adversity	Can See Over Some Buildings
KOP 3 (NM-2): Sports Arena & Rosecrans North Midway Sub-Area	Moderate Adversity	Silhouette with the Sky
KOP 4 (CM-2): Midway Drive & OTC Site 2 in Central Midway Sub-Area	Moderate Adversity	Silhouette with the Sky
KOP 5 (SP-2): Trolley Station at Washington in South Midway Sub-Area	None, Low or Moderately Low	No Position Impact
KOP 6 (OT-1): Park at Old Town State Park in Old Town Sub-Area	None, Low or Moderately Low	No Position Impact
KOP 7 (OT-6): Old Town Avenue in Old Town Sub-Area	High Adversity	Silhouette Against the Ocean Horizon
KOP 8 (NP-1): Presidio Park in North Mission Hills Sub-Area	High Adversity	Silhouette Against the Ocean Horizon
KOP 9 (NP-3): Altamirano & Presidio Drive in North Mission Hills Sub-Area	High Adversity	Silhouette Against the Ocean Horizon
KOP 10 (CH-2): Hayden & Linwood in Central Mission Hills Sub-Area	High Adversity	Silhouette Against the Ocean Horizon

Note: (1) Impacts determined by Amount of View Blockage as well as the Position of the Blockage based on context. View Blockage Gradient: None, Low or Moderately Low; Moderate Adversity; Moderately High Adversity; High Adversity. Moderately high and high impacts are considered a significant impact. Position Blockage Gradient: No Position Impact; Can see over some buildings; Silhouettes with the sky; Silhouettes against the ocean horizon.

SD-c. Would Alternative 4 exceed the allowed height or bulk regulations, and this excess results in a substantial view blockage from a public viewing area?

In November 2020, San Diego voters passed Measure E, which ends the 30-foot height limit for new buildings in the Midway District. However, there is an outstanding lawsuit challenging Measure E's validity, that could delay the measure's implementation. Currently, OTC is federal property and lands owned by the federal government are not subject to local land use regulations or Municipal Codes. The proposed height (maximum of 350 feet) and massing of all high-rise and mid-rise buildings proposed under Alternative 4 would result in potentially significant view blockage from many public viewing areas of regionally and sub-regionally important viewing scenes including the Pacific Ocean, Mission Bay, San Diego Bay, San Diego River, Cabrillo Point, and the Point Loma Peninsula, as shown above in Tables 2.3-2 and 2.3-3.

SD-d. Would Alternative 4 have a cumulative effect by opening up a new area for development, which will ultimately cause "extensive" view blockage?

The development proposed under Alternative 4 would be contained within OTC Site 1 and OTC Site 2 and would not open up new areas within the Midway-Pacific Highway Community Planning Area for development. Other development outside of OTC on land that is not federally owned would be subject to the Midway-Pacific Highway Community Plan guidelines and subject to approvals and public review per local laws and regulations.

Mitigation Measures and Residual Impacts

In order to minimize potentially significant impacts to view corridors, view blockage, and view quality, the following considerations would be applied during site-specific planning and design:

- **VIS-1: Limitations to Avoid Silhouetting against the Ocean Horizon.** Any efforts that can be done to limit the number of buildings that are silhouetted against the horizon line of the Pacific Ocean would be instrumental in lowering the adversity of view impacts. This type of intrusion into the horizon line causes the rare occurrence of a very open and unimpeded view over the ocean to be impacted. As can be seen in some areas with offshore drilling rigs that are relatively small from a distance, they are very impactful in breaking the continuous line of the horizon. The ability to step down buildings with perhaps some buildings still piercing the horizon line would be an alternative to consider that would minimize this impact. A single tower or multiple tall towers that break this line without a transition of other buildings around it that are shorter focuses the attention on a stark contrast in scale change. Specific areas of concern include the northwest views from North, Central and South Mission Hills sub-areas looking toward the Pacific Ocean to the west. If the north end of OTC Site 1 is tapered and pulled back from this location, many public and private views would still see the Pacific Ocean to the west and northwest, although much of the view may still be blocked by buildings.
- **VIS-2: Height Limitation to Avoid Silhouetting against the Sky.** Of lesser impact, but still important to consider, would be any buildings that push above the natural landforms of the area. A building that extends above the top of landforms from various viewpoints would be more impactful than a building that is low enough to see landforms to the west (Cabrillo Point and the Point Loma Peninsula as seen from the east) and to the east (Mission Hills/Presidio and North Mission Valley landforms as seen from the west). It would not be possible to avoid sky silhouetting in all areas of the viewshed. Only those viewing locations at higher elevations would

be positively affected by this change. Particular areas of concern would include buildings seen from the Midway District area around Sports Arena, Rosecrans, and Midway. The Old Town State Park area would benefit by lowered building heights for State Park gathering locations where the stark contrast in heights is emphasized by the existing low building heights.

- **VIS-3. Stepping Down Building Heights to Adjacent Areas.** If some buildings were kept tall and pierced the ocean's horizon line or those of adjacent landforms, it would still be effective to lower the overall sense of scale dominance by stepping down buildings in all directions. As seen from the Interstate 5 freeway, having buildings on the north end step upward to the taller buildings would assist in minimizing the stark contrast of scale. Stepping down building heights would also help in the Midway District, and views from Mission Hills could be improved as well. As seen from the Presidio, the stepping down of buildings would help with the transition to the rest of the surrounding existing development. From Central Mission Hills, a better transition would be very helpful in minimizing view impacts if the north end were adjusted to taper these buildings more in the northerly direction.
- **VIS-4. View Corridors to be Kept Open.** Making a tower taller and creating gaps between other buildings may resolve some view corridor problems. However, what may allow some view corridors to be more open may force the bulk of the massing to another location that may increase the view blockage in another area view corridor. But the San Diego subregion has specific viewing locations with public and major private views in known areas. It has clear sub-regionally important viewing scenes that are most visible to these viewing locations. With some level of effort, it would be possible to find the best locations for building gaps and building orientation. The important viewing scenes of greatest concern tend to be from the northeast looking to the southwest with views of San Diego Bay, Coronado, Cabrillo Point, and the Pacific Ocean. Areas in Central and South Mission Hills would not have this southwest looking view blocked, but North Mission Hills would. For those views from the southwest looking back to the Presidio and Mission Valley, the angle of the view corridor left open for the North Mission Hills area would benefit those looking back to Mission Hills as well. The other important view corridor tends to be in Central Mission Hills, looking to the northwest with views of Mission Bay, the San Diego River, and the Pacific Ocean to the west. This corridor could be kept more open with the transition downward of some of the heights of the buildings at the north end of the building complex (refer to VIS-3) instead of a gap between buildings.
- **VIS-5. Centralized Massing to Minimize the Number of Buildings.** Narrow but tall buildings tend to make the complex look like a city downtown instead of a major complex of related buildings. This phenomenon is caused by the fact that it is difficult to tell the scale of buildings. A tall building is more often a full city block size, so many may perceive of the size of a complex like this to be as many blocks long as there are individual buildings. In addition, the offsets of buildings that are not aligned with each other can contribute to more of the corridors being blocked. This would be similar to a forest of trees that are not aligned with each other compared to an agricultural orchard where a person can see unobstructed down through certain viewing angles, but not at all from other angles. To avoid this phenomenon, less towers that are more massive in bulk and that are aligned with the northeast to southwest corridor alignment would improve the opening of view corridors and lower the sense of scale that the multiple buildings may be exaggerating.

With these measures implemented, the impacts would be minimized, but would still remain significant and unavoidable.

AES-b: Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Potentially significant impact. No natural resources would be impacted by the construction of Alternative 4 as OTC Site 1 and OTC Site 2 are already developed with buildings and parking lots. Both Interstate 8 and Interstate 5 are eligible for scenic designation, but the City of San Diego has not requested Caltrans to designate them as scenic. The City of San Diego has a locally designated 59-mile scenic route that passes through Old Town, Presidio Park, and North Mission Hills. The development under Alternative 4 would block some views from both Interstate 8 and Interstate 5, as well as the City of San Diego's scenic route.

Mitigation Measures and Residual Impacts

Measures VIS-1 to VIS-5, described above, would be applied to minimize impacts. However, even with these measures, the impacts under Alternative 4 would remain significant and unavoidable.

AES-c: If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?

Potentially significant impact. Aesthetic quality impacts must consider the context of the adjacent area and the amount of contrast that Alternative 4 would have with that context. While the specific details for the site layout and building design are not currently known, the simulations created for consider a representative development of a certain mass and scale under Alternative 4. The following assumptions were used to define the visual components of the Proposed Action for this impact analysis:

- Based on the investment required by this project, it is assumed that project designs would represent the industry standard for design aesthetics and architectural quality.
- The proposed buildings are likely to be a combination of concrete, steel, composite architectural materials, and various types and colors of glass.
- Given the potential views that would be available from the proposed new buildings, it is likely that the buildings would utilize a substantial amount of glass and potentially provide balcony areas to take advantage of these views.
- It is anticipated that most of the proposed buildings would include architectural forms that are interesting and iconic and would not likely have flat roofs, or monotonous elevations or fenestration of building design elements.
- Building utilities, storage areas, delivery locations, and other functional elements of a complex of buildings are assumed to be appropriately screened and enclosed.
- Parking structures are assumed to include some level of architectural design and screening. Concrete only materials are not assumed in the simulation modeling. Views into the proposed structure are assumed to not be available as a basic assumption and design condition of approval. All parking structure shall provide vertical screening including metal mesh, perforated metal or welded wire with vine plantings, or using concrete brows to limit the visibility into the operating portions of the structure and to avoid directly viewing hanging lights and utility conduits and piping.

The Landscape Assessment Units around the site to the south, west, and north have an overall existing lower visual quality than Landscape Assessment Units to the east (see EIS Appendix F, Section 1.3 for a detailed description of how Landscape Assessment Units were identified and ranked). Therefore, the contrast with the quality of the adjacent areas would not create a high contrast of visual quality to these areas. Therefore, Alternative 4 would be expected to have a positive impact on the existing aesthetics of these adjacent areas and on the overall visual environment for this part of the study area**.** However, the Landscape Assessment Units around the site to the northeast, east, and southeast do have a higher existing visual quality, and Alternative 4 would slightly lower the visual quality of these areas.

Due to the older nature of the existing buildings and large areas of surface parking on OTC, the existing visual quality of the site would be improved by the architectural, site planning, and landscape architectural treatments developed under Alternative 4. Additional detail is provided in the responses to the City of San Diego significance determination criteria below.

SD-e. Would Alternative 4 exceed the allowable height or bulk regulations and the height and bulk of the existing patterns of development in the vicinity of the project by a substantial margin? and

SD-h. Is the project located in a highly visible area and would it strongly contrast with the surrounding development through excessive height, bulk, signage, or architectural projections?

OTC is federal property and as such is not under regulatory control by the City of San Diego. However, OTC is in a highly visible area of the subregion, including Interstate 5 and Interstate 8, dozens of public roads, parks, state historic parks and thousands of private properties. The adjacent hillsides also create a larger than normal viewshed. The development proposed under Alternative 4 would highly contrast with the adjacent height and bulk patterns of the area, whether to the north, west, south, or east. This contrast would be very high considering the average height of the adjacent community area is 10-30 feet in height, with the proposed project buildings consisting of 35 high-rise buildings (350 feet tall) and 51 mid-rise buildings (240 feet tall) resulting in a more than 10-time multiplier in heights. The massing of the buildings would be 20 to 40 times larger than the massing of adjacent buildings.

Table 2.3-4 presents the degree of change to visual quality that would occur under Alternative 4 as viewed from the 10 KOPs selected around OTC. Simulations from each KOP are provided in EIS Appendix F, Attachment B.

Table 2.3-4 Summary of Alternative 4 Visual Quality Impacts

Key Observation Point	***Existing Average Quality(1)***	***Resulting Predicted Visual Quality(1)***	***Degree of Visual Quality Change***
KOP 1 (IN-1): Interstate 5 Southbound	Moderate	High	Moderately Improved Quality
KOP 2 (PC-2): Pacific Coast Highway Northbound in South Midway Sub-Area	Moderately Low	Moderately High	Major Quality Improvement
KOP 3 (NM-2): Sports Arena & Rosecrans North Midway Sub-Area	Low	Moderately Low	Slightly Improved Quality
KOP 4 (CM-2): Midway Drive & OTC Site 2 in Central Midway Sub-Area	Low	Moderately High	Major Quality Improvement

Key Observation Point	*Existing Average Quality*[(1)]	*Resulting Predicted Visual Quality*[(1)]	*Degree of Visual Quality Change*
KOP 5 (SP-2): Trolley Station at Washington in South Midway Sub-Area	Moderately High	Moderately High	No Change
KOP 6 (OT-1): Park at Old Town State Park in Old Town Sub-Area	Moderately High	Low	Major Lowered Quality
KOP 7 (OT-6): Old Town Avenue in Old Town Sub-Area	Moderately High	Moderate	Slightly Lowered Quality
KOP 8 (NP-1): Presidio Park in North Mission Hills Sub-Area	High	Moderately Low	Major Lowered Quality
KOP 9 (NP-3): Altamirano & Presidio Drive in North Mission Hills Sub-Area	High	Moderately Low	Major Lowered Quality
KOP 10 (CH-2): Hayden & Linwood in Central Mission Hills Sub-Area	High	Moderate	Moderately Lowered Quality

Note: (1) Categories for Visual Quality Using an Average of Vividness, Unity, and Intactness Rankings. Existing Average Quality Values: Low; Moderately Low; Moderate; Moderately High; High. Resulting Predicted Visual Quality Values: Low; Moderately Low; Moderate; Moderately High; High. Moderately high and high impacts are considered a significant impact. Degree of change values: Major Quality Improvement (Improved 3 or more levels); Moderately Improved Quality (Improved 2 levels); Slightly Improved Quality (Improved 1 level); No Change; Slightly Lowered Quality (Degraded 1 level); Moderately Lowered Quality (Degraded 2 levels); Major Lowered Quality (Degraded 3 or more levels).

SD-f. Would Alternative 4 have an architectural style or use building materials in stark contrast to adjacent development where the adjacent development follows a single or common architectural theme? and

SD-n. Would Alternative 4 create a disorganized appearance and would this appearance substantially conflict with City codes enforced in the nearby areas around the site? and

SD-o. Would Alternative 4 significantly conflict with the height, bulk, or coverage regulations of the zone and does not provide architectural interest? and

SD-q. Would Alternative 4 development be large and would result in an exceeding monotonous visual environment (e.g., a large subdivision in which all the units are virtually identical)?

If Alternative 4 is selected by the Navy for implementation, the public-private developer would undergo detailed site planning, including a review of design concepts. Thus, the development under Alternative 4 may have a consistent style of buildings, although it is likely to include some variation in the architectural forms within the development to avoid a monotonous appearance. The materials would be modern, such as concrete, steel, metal, glass, and stucco. The adjacent building architectural styles, materials, and character differ widely and there is no pattern of consistency. Therefore, Alternative 4 would not present a stark contrast to an existing common architectural theme.

Alternative 4 would create a consistent and modern building design and overall site planning would result in an improvement to OTC, although in high contrast with its setting.

SD-i. Would the project have a cumulative effect by opening up a new area for development or changing the overall character of the area?

The development on OTC under Alternative 4 would be contained within the boundaries if OTC Site 1 and OTC Site 2, but the mixed-use development does have the potential to encourage or entice new development in the area. This would be the result of land value increases, improved economic conditions, and increased public infrastructure resulting from the proposed development under Alternative 4. As described above, OTC is federally owned and is not under regulatory control by the City of San Diego. However, adjacent land is regulated by zoning, policies, plans, and restrictions placed on them by the City of San Diego to prevent major changes to the character of the area. The Midway-Pacific Highway Community Plan (City of San Diego, 2019d) guides development for the immediate area surrounding OTC, and the plan includes a vision that increases the residential population in the area and creates cohesive districts within overall community planning area. Mixed-use development was proposed for the “Dutch Flats” district where OTC is located, albeit the proposed develop does exceed the density envisioned under the community plan. The visual character of the proposed development under Alternative 4 would be consistent with types of future development encouraged by the Midway-Pacific Highway Community Plan. Additional analysis related to potential growth inducement are addressed under Section 2.5 of this appendix.

SD-p. Would the project include a crib wall or retaining wall, or noise walls greater than 6 feet in height and 50 feet in length with minimal landscape screening or berming where the walls would be visible to the public?

It is likely that some details of Alternative 4 would include major wall structures that would have visibility to the public in public viewing locations. Although the project does not have enough detail associated with it to make a firm determination, it is likely that walls supporting parking structures or hiding parking or other utilitarian structures would be part of the project.

Mitigation Measures and Residual Impacts

In order to minimize potentially significant impacts to aesthetics, and neighborhood/community character, the following considerations would be applied during site-specific planning and design:

- **VIS-6. Conceal or Integrate Parking Garages.** Looking from the west side of OTC Site 2 or from many parts of OTC Site 1, the presence of parking structures would not be that significant of a visual quality issue. This assumes that parking structures do not allow for large openings in the elevations that allow a person to see parked cars and hanging lights and utility piping. A lower parapet style wall to conceal parked cars and a brow from the upper floor are both essential to limit visual penetration into the structure and vehicle light and parking garage lighting to spill out. The exterior materials must be made to relate to the adjacent building elevations and materials. The use of a vertical perforated screens or patterned laser cut metal panels or offsetting planes that allow air and light in, but that obscure clear views in would be essential. Design treatments on the east facing edge of the complex must receive even more integration with the architecture. A potential 30-foot-high elevated plaza with parking under the plaza would be an appropriate solution to partially exposed parking structures that are shown on the mass models used in this study (see Simulation 1 for all alternatives where the parking structures are clearly different than the rest of the architecture in Appendix F, Attachment B). The modeling shown in this study does have the appropriate minimal gap for each floor of the garage. However, the material changes between the lower portion of the building with parking and the rest of the building should be less noticeable.

- **VIS-7. Maintain Horizontal Banding and Fenestration on Buildings.** It is common for architecture to portray dynamic vertical elements to accentuate the overall scale and iconic power of the building. However, the overall structure of tall buildings is already strongly vertical. Horizontal banding and fenestration that sets each floor as a horizontal design element helps to reduce the apparent size of the building.
- **VIS-8. Integrate and Connect a Series of Plazas, Streets and Spaces.** A strong foundation of an elevated or terraced set of open-air spaces at the ground levels of buildings would be important to make the project feel as though it is a campus-like setting instead of a series of buildings and streets like many downtown areas. The park and recreation requirements and pedestrian circulation needs of the project should require a substantial amount of the ground-plane to be landscaped and contain pedestrian-scaled spaces. A potential 30-foot-high elevated plaza structure would go a long way to create this integrated and connected public space. This space would also help in creating and maintaining some of the view corridors across the site.

With these measures implemented, the impacts would be minimized, but would still remain significant and unavoidable.

AES-d: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Potentially significant impact. Alternative 4 would likely create conditions that would cause light and glare impacts, but these cannot be fully analyzed until site design and detail is available. However, based on the scale of the proposed development under Alternative 4, including the height, size, and position of buildings and their lighting needs, potential building materials (e.g., glass, steel), and types of uses (e.g., hotels that require nighttime lighting), impacts would be presumed to occur. Additional detail is provided in the responses to the City of San Diego significance determination criteria below.

SD-s. Would Alternative 4 be moderate to large in scale, more than 50 percent of any single elevation of a building's exterior is built with a material with a light reflectivity greater than 30 percent (see Land Development Code Section 142.07330(a)), and the project is adjacent to a major public roadway or public area?

While the specific details for the site layout and building design are not currently known, the proposed development under Alternative 4 would be large in scale and would likely include exteriors with reflective materials such as glass and metal. The project is adjacent to Interstate 5 and Interstate 8 along with numerous public roadways.

SD-t. The project would shed substantial light onto adjacent, light-sensitive property or land use, or would emit a substantial amount of ambient light into the nighttime sky.

The proposed development under Alternative 4 includes mid to high-rise buildings and may include signage or reflective building materials (e.g., glass, metal) that could reflect into areas that are highly visible to off-site glare-sensitive uses. Uses considered to be light-sensitive to nighttime light or glare-sensitive to daytime reflected solar light, include residential, some commercial, and natural areas. They are recognized as light-sensitive because they are typically occupied by persons who have expectations for privacy during evening hours and who are subject to disturbance by bright light sources. They are recognized as glare-sensitive because they are typically occupied by persons who have expectations for a comfortable exterior use on their own property that may be affected by high levels of glare. Land uses adjacent to OTC that would be sensitive to light and glare are presented in Section 3.3.3, Affected Environment, of the EIS in Figure 3.3-8.

Without detailed analysis of photometrics, light sources, and light systems being available at this stage of the project, determining the level of impact at this time is to be difficult. Thus, it assumed the proposed development under Alternative 4 would exceed the 2.0-foot candle spill over light threshold at the at the property line, per the measurement procedures outlined by the Illuminating Engineering Society of North America.

Mitigation Measures and Residual Impacts

In order to minimize potentially significant impacts related to light and glare, the following considerations would be applied during site-specific planning and design:

- **VIS-9. Exterior lighting would be architecturally integrated with the character of all structures, energy-efficient, and shielded or recessed so that direct glare and reflections would be confined, to the maximum extent feasible, within the boundaries of OTC.** Exterior lighting would be directed downward and away from adjacent properties and public rights-of-way. Shielded means that the light rays would be directed onto OTC and the light source, whether bulb or tube, would not be visible from an adjacent property. All parking and security lighting would consist of full cutoff fixtures unless a different cutoff classification is specifically authorized through the architectural review process.
- **VIS-10. Obtrusive light would be minimized by limiting outdoor lighting that is misdirected, excessive, or unnecessary, and light required for the development would be directed downward to minimize spill over onto adjacent properties and reduce vertical glare or up-lighting.**
- **VIS-11. The project would be required to meet the lighting standards contained in the CALGreen Code for green building standards.** This code is issued by the Building Standard Commission of the California Department of General Services. The project would comply with standards contained in the CALGreen Code for reducing light pollution.
- **VIS-12. The lighting plan would need to be consistent with the U.S. Green Building Council's LEED Green Building Rating System requirement**s. The project would need to achieve at least the U.S. Green Building Council's LEED v4 Silver certification. Consistency with LEED requirements would reduce both the generation of exterior light and the potential for light trespass to affect off-site areas.
- **VIS-13. Light-emitting diode light fixtures would be considered for all interior and exterior lighting and fixtures and would be selected based on architectural aesthetic, efficiency, maintenance, and glare control.**
- **VIS-14. Professionally recommended lighting levels should be determined for each activity areas to prevent over-lighting and reduce electricity consumption.**
- **VIS-15. Shielded fixtures with efficient light bulbs would be used in the parking lot to prevent any glare and light spillage beyond the property line.** Shielded fixtures would also help in preventing light pollution of the dark sky.

- **VIS-16. To protect spill over on Interstate 5 and the Pacific Highway, luminaries would be shielded, reduced in intensity, or otherwise protected from view**, such that the brightness of a light source within 10 degrees from a driver's normal line of sight would not be more than 1,000 times the minimum measured brightness in the driver's field of view, except when minimum values are less than 10 foot-lambert. If minimum values are below 10 foot-lambert, the source brightness would not exceed 500 foot-lambert plus 100 times the angle, in degrees, between the driver's line of sight and the light source.
- **VIS-17. The maximum measurable luminance of the illuminated building façade would not exceed 40 candela per square meter.** Additionally, an area weighted average of field measurements would not exceed 10 candela per square meter for any single contiguous façade area greater than 7,500 square feet in area.
- **VIS-18. Glass used in building façades would be anti-reflective or treated with an anti-reflective coating in order to minimize glare.**
- **VIS-19. The following treatments would be avoided as part of the Proposed Action materials:**
    - Reflective glass that exceeds 50 percent of any building surface and none on the bottom three floors
    - Mirrored glass
    - Black glass that exceeds 25 percent of any surface of a building
    - Metal building materials that exceed 50 percent of any street facing surface
    - Exposed concrete that exceeds 50 percent of any building

  The following use of building materials would be encouraged:

    - Natural stone
    - Galvanized metal
    - Matte or low gloss painted materials including steel, metal, and wood
    - Precast concrete panels with low reflectivity
    - Clear or lightly tinted glass
    - Brushed stainless steel versus polished stainless steel
    - Anodized aluminum
    - Composite panels that are not pure or bright white

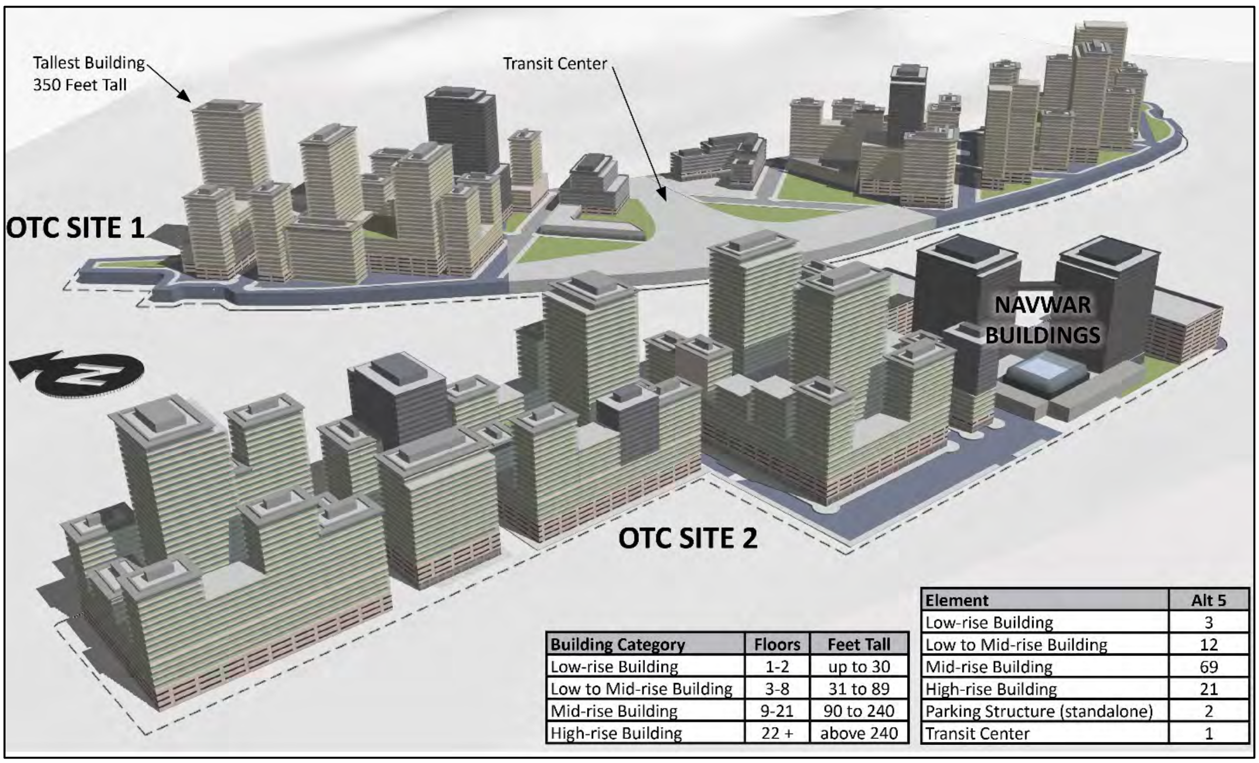
With these measures implemented, the impacts would be minimized, but would still remain significant and unavoidable.

2.3.1.4 Alternative 5 Impacts

The proposed development under Alternative 5 includes buildings up to 350 feet tall. Figure 2.3-2 represents a three-dimensional model of massing that would accommodate the needs of this alternative. This diagram is not intended to show an actual architectural design nor to commit to any massing arrangement of these buildings This diagram is not intended to show an actual architectural design nor to commit to any massing arrangement of these buildings other than indicating the general height, number of floors, and parking structures needed to represent the programmatic requirements of the alternatives. The model does show the major physical elements that would be likely to have a high level of visual prominence. The table in Figure 2.3-2 provides a summary of the major physical features of the alternative including floors, heights, and number of total buildings being considered. Simulations of the proposed development under Alternative 5 in the context of the existing visual setting from KOPs selected from within a 1-mile radius of OTC are presented in the EIS Appendix F, Attachment B.

The NAVWAR facilities would be the same as described under Alternative 4. The major difference between Alternative 4 and 5 is that Alternative 4 would have 35 high-rise buildings (350 feet tall) and 51 mid-rise buildings (240 feet tall) whereas Alternative 5 would have 21 high-rise buildings (350 feet tall) and 69 mid-rise buildings (240 feet tall).

Impacts under Alternative 5 would be similar to but slightly less than those described for Alternative 4, as the development density is slightly reduced. Differences would be most pronounced in relation to potential view blockage, due to differences in the massing and positions of the buildings on OTC Site 1 and OTC Site 2. Table 2.3-5 identifies 10 sub-regionally important viewing scenes that have the potential to be blocked by the proposed development on OTC under Alternative 5. Alternative 5 would potentially block from 21 percent to 65 percent of the total views, with special concern for affected views of San Diego Bay, Coronado, Mission Bay, San Diego River, Cabrillo Point, and the Point Loma Hillside.



Building Category	Floors	Feet Tall
Low-rise Building	1-2	up to 30
Low to Mid-rise Building	3-8	31 to 89
Mid-rise Building	9-21	90 to 240
High-rise Building	22 +	above 240

Element	Alt 5
Low-rise Building	3
Low to Mid-rise Building	12
Mid-rise Building	69
High-rise Building	21
Parking Structure (standalone)	2
Transit Center	1

Figure 2.3-2 General Building Massing of Alternative 5

Table 2.3-5 Summary of Alternative 5 Viewing Scene Impacts

Viewing Scene[(1)]	*Percent of Area*	*Persons (based on 2016 pop.) within the Viewshed Limits*	*Persons (based on 2016 pop.) Likely to see the Site[(2)]*	*Persons (based on 2035 pop.) within the Viewshed Limits*	*Persons (based on 2035 pop.) Likely to see the Site [(2)]*
1. San Diego River	59.49%	3,876	2,306	3,776	2,246
2. Mission Bay	37.94%	3,876	1,470	3,776	1,433
3. Mission Valley North	65.36%	2,143	1,401	2,314	1,512
4. Presidio/Mission Hills	32.60%	11,560	3,768	13,852	4,515
5. Pacific Ocean West	25.44%	4,220	1,073	3,874	985
6. Pacific Ocean Southwest	36.15%	2,550	922	1,994	721
7. San Diego Bay/Coronado	38.05%	6,038	2,298	6,782	2,581
8. Cabrillo	24.68%	4,927	1,216	4,538	1,120
9. Pt Loma Hillside	46.01%	9,059	4,168	9,162	4,215
10. Downtown Skyline	21.28%	1,158	246	2,606	554
Average Percent of View Blocked[(1)]	38.70%	24,154[(3)]	9,347	25,528[(3)]	9,879

Legend: % = percent; Pop. = Population; SD = San Diego.

Notes: (1) Percent of view area affected is based upon a topographic model only and does not include buildings, structures.

(2) Persons affected were based on SANDAG Master Geographical Reference Areas estimates for 2016 and 2035. Calculations assumed even distribution across Master Geographical Reference Areas.

(3) Populations in the various viewing locations overlap. This number has taken out the double counting of persons.

Changes in view quality were further analyzed from 10 KOPs (refer to EIS Section 3.3.3, *Affected Environment*, for how these points were selected). A simulation of the proposed development was inserted into the photo from each KOP to analyze the degree of view blockage that would be anticipated at that location. Simulations showing views of the proposed development under Alternative 5 from all 10 KOPs are provided in EIS Appendix F, Attachment B. As shown below in Table 2.3-6, KOPs 2, 3, 4, 5, and 6 would experience less than significant (none to moderate adversity) view blockage under Alternative 5. Potentially significant impacts (moderately high and high adversity) would occur at KOPs 1, 7, 8, 9, and 10.

Table 2.3-6 Summary of Alternative 5 View Quality Impacts

Key Observation Point	*Viewing Blockage Expected[(1)]*	*Positioning of Blockage[(1)]*
KOP 1 (IN-1): Interstate 5 Southbound	Moderately High Adversity	Silhouette with the Sky
KOP 2 (PC-2): Pacific Coast Highway Northbound in South Midway Sub-Area	Moderate Adversity	Can See Over Some Buildings
KOP 3 (NM-2): Sports Arena & Rosecrans North Midway Sub-Area	None, Low or Moderately Low	Silhouette with the Sky
KOP 4 (CM-2): Midway Drive & OTC Site 2 in Central Midway Sub-Area	Moderate Adversity	Silhouette with the Sky
KOP 5 (SP-2): Trolley Station at Washington in South Midway Sub-Area	None, Low or Moderately Low	No Position Impact
KOP 6 (OT-1): Park at Old Town State Park in Old Town Sub-Area	None, Low or Moderately Low	No Position Impact

Key Observation Point	*Viewing Blockage Expected*(1)	*Positioning of Blockage*(1)
KOP 7 (OT-6): Old Town Avenue in Old Town Sub-Area	High Adversity	Silhouette Against the Ocean Horizon
KOP 8 (NP-1): Presidio Park in North Mission Hills Sub-Area	High Adversity	Silhouette Against the Ocean Horizon
KOP 9 (NP-3): Altamirano & Presidio Drive in North Mission Hills Sub-Area	High Adversity	Silhouette Against the Ocean Horizon
KOP 10 (CH-2): Hayden & Linwood in Central Mission Hills Sub-Area	High Adversity	Silhouette Against the Ocean Horizon

Note: (1) Impacts determined by Amount of View Blockage as well as the Position of the Blockage based on context. View Blockage Gradient: None, Low or Moderately Low; Moderate Adversity; Moderately High Adversity; High Adversity. Moderately high and high impacts are considered a significant impact. Position Blockage Gradient: No Position Impact; Can see over some buildings; Silhouettes with the sky; Silhouettes against the ocean horizon.

Mitigation Measures and Residual Impacts

In order to minimize potentially significant impacts to visual resources, the considerations described under Alternative 4, VIS-1 to VIS-19, would be applied during site-specific planning and design. With these measures implemented, the impacts would be minimized, but would still remain significant and unavoidable under significance criteria AES-a to AES-d.

In order to minimize potentially significant impacts to visual resources, the considerations described under Alternative 4, VIS-1 to VIS-19, would be applied during site-specific planning and design to this Alternative 5. With these measures implemented, the impacts would be minimized, but would still remain significant and unavoidable under significance criteria AES-1 to AES-4.

2.3.1 Temporary Construction Impacts

The scale of Alternative 4 and Alternative 5 are such that major construction will occur over a several year period and the scale of the contractor laydown areas, staging areas and construction areas will be large and likely highly visible. The demolition of other buildings will also last over several months of demolition activity. In addition, construction-related rigging, scaffolding, and construction cranes are also expected to be highly visible and will last over several year phasing of demolition and construction.

No contractor laydown area has been identified but it is assumed it will not be one primary area. Construction staging, storage and surge areas would be expected to be distributed throughout OTC Site 1 and OTC Site 2. All existing buildings that will be demolished, would likely have surge piles of demolished material sitting for several months.

Normally, major disturbances that contrast with the existing visual setting and character of the adjacent areas around OTC Site 1 and OTC Site 2 would be considered temporary. Construction on a typical tall building will likely last from 1-2 years per building and likely 5-10 years for a few phases of the project. Typically, any change to an area that remains under 5 years is considered to be temporary. Although the overall project phasing could take up to 20 years, individual phases are assumed to be less than 5 years.

Construction materials are commonly stored in a haphazard and cluttered manner. This analysis assumes that unless required, construction activities and areas are likely to create a negative aesthetic for different areas of OTC Site 1 and OTC Site 2. Given that many viewing locations around the site, are substantially higher than the project site, fencing and screening is not likely to resolve the visibility of these areas. Therefore, a temporary significant impact to visual quality, community character and aesthetics would be expected. This would apply equally to Alternative 4 and Alternative 5.

Mitigation Measures and Unavoidable Significant Impacts

The following measures would be used in order to address this temporary significant visual impact:

- VIS-20: All staging and storage areas that contain material that is left over night, shall utilize construction fencing with green fabric screening. Care will be provided to make sure that these storage areas are reasonably organized to avoid a haphazard and chaotic appearance.
- VIS-21: Storage of demolished materials that are not intended to be recycled, will be removed from the site and disposed of properly on a weekly basis. Materials that are being recycled should be processed and removed or re-incorporated into the project within a 6-month period.
- VIS 22: Dust control, litter control and flat surface areas will be cleaned on a weekly basis.

If measures VIS-20 to -22 are executed on the project site, then the significant temporary impacts are considered to be lowered to less than significant for visual, community character and aesthetic impacts.

2.3.2 Cumulative Impacts

2.3.2.1 Description of Geographic Study Area

The AVE for evaluating cumulative impacts on visual resources is defined as the project area and adjacent communities (i.e., the Midway-Pacific Highway, Old Town, and Uptown communities).

2.3.2.2 Relevant Past, Present, and Future Actions

Table 4.3-2 of the EIS lists the reasonably foreseeable cumulative actions that might interact with the affected resource areas of the action alternatives and cumulatively affect visual resources within the AVE. The projects include military and non-military construction and development projects. The identified cumulative military projects at OTC and Marine Corps Recruit Depot San Diego would all be consistent with the existing visual environment, and therefore are not considered in this analysis.

Management plans such as the San Diego General Plan, the community plans, and regional transportation plans/programs all have the potential to affect the visual environment. Proposed and reasonably foreseeable construction projects, such as the expansion of the San Diego International Airport, improvements to Port of San Diego lands, the Sports Arena redevelopment, The Post project, and other large development projects (e.g., Riverwalk and University of California San Diego Long Range Development Plan) would alter the visual environment in their vicinities.

As detailed in the Midway-Pacific Highway Community Plan and further demonstrated by several of the identified cumulative projects, the Midway-Pacific Highway area is poised for major redevelopment in the coming years. Collectively, these and other projects have the potential to alter the existing visual environment of the area, irrespective of the Proposed Action Alternatives considered in this EIS.

The Midway-Pacific Highway Community Plan encourages buildings and streetscape improvements that would enhance the visual character along Pacific Highway. New buildings would incorporate modulations, articulations, stepbacks, and different transparencies, and use contemporary and high-quality materials with varying colors and textures to create visual appeal. The Community Plan also notes that complementary mobility and infrastructure improvements within and near the larger parcels, would improve the community's visual character (City of San Diego, 2018).

2.3.2.3 Cumulative Impact Analysis

As described above, Alternatives 4 or 5 would result in potentially significant impacts to visual resources. Even with minimization measures VIS-1 to VIS-19 implemented to minimize potential visual impacts, the impacts would not be reduced to a less than significant level.

Due to the heights of the proposed buildings (350 feet), implementation of Alternative 4 or 5 would have the potential to partially obscure some views of the annual Independence Day Big Bay Boom Fireworks Display (Project #26) in San Diego Bay from lower elevation viewers east of OTC in the Mission Hills area. The Big Bay Boom show uses predominantly 8- and 10-inch diameter firework shells (Port of San Diego, 2019). These shells send the firework a corresponding height of approximately 800 feet and 1,000 feet, respectively (Pyrotechnic Innovations, 2020). Despite the fact that fireworks display would be much higher than the proposed buildings, other better viewing areas being available, and the potential area of occlusion would be small and decrease with increasing elevation, there would be a localized, minor, and partial visual disruption and associated impact to some lower elevation viewers located in North Mission Hills.

The cumulative projects in the geographic extent, such as the Sports Arena redevelopment, The Post urban office complex, the San Diego International Airport Terminal 1 expansion, and the large commercial development projects would be developed consistent with the existing visual environment in their immediate vicinity – or increase the overall visual appeal in accordance with the measures identified in the Midway-Pacific Highway Community Plan. The identified cumulative projects would also be consistent with the existing visual environment as they would comply with current height restrictions and/or would be consistent with the approved planning documents pertaining to visual appeal, unless otherwise exempt. Therefore, implementation of Alternatives 4 or 5 when combined with the past, present, and reasonably foreseeable future projects would result in potentially significant cumulative impacts to visual resources within the AVE.

2.4 Land Use/Planning, Recreation, and Agriculture and Forestry Resources

Land use is a foundational element of local city and county planning processes and is utilized to identify important community issues, project future demand for services, anticipate potential conflicts, and establish goals and policies for directing and managing growth. Local governments utilize a variety of tools in the planning process including regional plans, general plans, specific plans, zoning, and ordinances.

Descriptions of the regulatory setting, environmental setting, and assessment methodology are presented in Sections 3.4.1, 3.4.2, and 3.4.3 of the EIS, respectively.

2.4.1 Impacts Determination

Impacts resulting from land use are determined by applying significance criteria to the potential change in land use that result from the alternatives.

2.4.1.1 Impacts Summary

Table 2.4-1 presents a summary of impacts related to land use/planning, recreation and agriculture and forestry for each criterion specified in CEQA Appendix G Environmental Checklist Form. Explanation of each impact conclusion is provided in the following subsections.

Table 2.4-1 Impacts Related to Land Use/Planning, Recreation, and Agriculture and Forestry Resources

Criteria	*Potentially Significant*	*Less than Significant with Mitigation*	*Less than Significant*	*No Impact*
II. AGRICULTURE AND FORESTRY RESOURCES (AG-) Would the project:	-	-	-	-
a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non- agricultural use?	-	-	-	**X**
b) Conflict with existing zoning for agricultural use, or a Williamson Act contract?	-	-	-	**X**
c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code Section 12220(g)), timberland (as defined by Public Resources Code Section 4526), or timberland zoned Timberland Production (as defined by Government Code Section 51104(g))?	-	-	-	**X**
d) Result in the loss of forest land or conversion of forest land to non-forest use?	-	-	-	**X**
e) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?	-	-	-	**X**
XI. LAND USE AND PLANNING (LU-) Would the project:	-	-	-	-
a) Physically divide an established community?	-	-	**X**	-
b) Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?	**X**	-	-	-
XVI. RECREATION (REC-) Would the project:	-	-	-	-
a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?	-	-	**X**	-
b) Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?	-	-	**X**	-

Legend: - = no data in cell; X = selection for Alternatives 4 and 5.

Approach for the Determination of Significance

In determining whether impacts to agricultural resources are significant environmental effects, lead agencies may refer to the California Agricultural Land Evaluation and Site Assessment Model (1997) prepared by the California Department of Conservation as an optional model to use in assessing impacts on agriculture and farmland. In determining whether impacts to forest resources, including timberland, are significant environmental effects, lead agencies may refer to information compiled by the California Department of Forestry and Fire Protection regarding the state's inventory of forest land, including the Forest and Range Assessment Project and the Forest Legacy Assessment project; and forest carbon measurement methodology provided in Forest Protocols adopted by the CARB.

2.4.1.2 No Action/No Project Alternative Impacts

The impacts of No Action Alternative for land use, planning, and recreation are described in Section 3.4.3.1 of the EIS, *Land Use*. There are no agriculture or forestry resources in the project area, so these topics are not addressed in the EIS. The No Action Alternative represents a continuation of existing land uses. Therefore, the No Action Alternative would result in less than significant impacts to land use, planning, recreation, and agriculture or forestry resources.

2.4.1.3 Alternative 4 Impacts

LU-a: Physically divide an established community?

Construction and Operations

Less than significant impact. Based on the existing land uses and physical configuration of OTC Site 1 and OTC Site 2 as shown in Figure 3.4-1 in the EIS, the building demolition, construction, and post-construction operations would not physically divide the Midway-Pacific Highway community beyond existing conditions. The configuration and placement of Interstate 5, existing rail lines, Pacific Highway, Sports Arena Boulevard, Barnett Avenue, and Midway Drive are the primary elements dividing the Midway-Pacific Highway community within the vicinity of OTC (see Figure 3.4-1 in the EIS). Interstate 5 and the rail lines also divide the Midway-Pacific Highway community from the Old Town community. Therefore, Alternative 4 would not divide the established community, and could potentially improve community connectivity by reducing the area on OTC required to meet Navy physical security requirements. Changes to the secure fenceline and controlled entry points surrounding the NAVWAR facilities on OTC could provide opportunities to connect Sports Arena Boulevard and Midway Drive. Integration of a transit center as part of Alternative 4 would not result in a change to the existing transit connectivity to the trolley and COASTER routes, as the existing functions of the Old Town Trolley Center would be consolidated on OTC.

Mitigation Measures and Residual Impacts

Significant impacts would not occur for this criterion, so no mitigation measures are required. Therefore, residual impacts are the same as the impacts described above.

LU-b: Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?

Construction and Operations

Significant impact. Overall, Alternative 4 is consistent with planning concepts identified in local, regional, and federal planning documents, but would exceed the development density and growth targets specified in the Midway-Pacific Highway Community Plan. Details are provided below with a conclusion that identifies how these differences were evaluated.

Table 2.4-2 presents the planned growth from the Midway-Pacific Highway Community Plan for household population, employment, residence (in dwelling units), nonresidential square feet, and population-based parkland compared Alternatives 4 and 5.

Table 2.4-2 Comparison of the Midway-Pacific Highway Community Plan Growth to Alternatives 4 and 5

Growth Area	***Community Plan-Existing (2015)***	***Community Plan-Planned Growth # (%)***	***Community Plan-Future (2045)***	***Alternative 4 # (% Planned Growth #)***	***Alternative 5 # (% Planned Growth #)***
Household Population	4,600	23,660 (514%)	28,260	14,364 (61%)	11,491 (49%)
Employment (Jobs)	15,200	4,370 (29%)	19,570	5,623 (129%)	3,823 (87%)
Residential (Dwelling Units)	1,935	10,155 (525%)	12,090	7,980 (79%)	6,384 (63%)
Nonresidential (SF)	9,800,000	300,000 (3.1%)	10,100,000	1,890,000 (630%)	1,340,000 (447%)
Parkland Inventory	***Community Plan-Existing (2015)***	***Community Plan-Planned Growth # (%)***	***Community Plan-Future (2045)***	***Alternative 4 # (% Planned Growth #)***	***Alternative 5 # (% Planned Growth #)***
Planned Parks	0	9.8	9.8	13.65	13.00
Park Equivalencies	0	13.51	13.51	4.35	5.50
Joint-Use Areas	0	1.5	1.5	0	0
Portion of Resource-based Park	0	3.3	3.3	0	0
Planned Recreation Center	0	1.75	1.75	0	0
Total Parkland	0	29.86	29.86	18.00	18.50
Population-based Park Requirement (2.8 acres / 1,000 population)	12.88	66.25	79.13	40.22	32.17
Parkland Surplus (Deficit)	(12.88)	(36.39)	(49.27)	(22.22)	(13.67)
Percentage of Requirement	0%	45%	38%	45%	56%

Legend: % = percent; SF = square feet.

Alternative 4 proposes 10,000 (7,980 occupied) dwelling units which is an additional 79 percent of growth compared to what is planned in the Community Plan. The floor to area ratio associated with the residential development is about 12.4 (similar to downtown San Diego), which is significantly higher than the approximate 2.0 that is stated in the Community Plan. The community plan was based on the 30-foot Coastal Height Limit Overlay Zone. However, since the community plans publication, Measure E was passed to end the 30-foot height limit for new buildings in the Midway District. Midway-Pacific Highway community planners are considering an update to the community plan in light of the potential mixed-use development on OTC and the elimination of the 30-foot height limit. This would likely include increased densities in the community plan for mixed-use development.

Alternative 4 proposes an increase of 14,364 to the household population which is an additional 61 percent of growth compared to what is in the Community Plan. This results in an additional 40.22 acres of population-based parkland of which the Alternative provides 18.00 acres, leaving a deficit of 22.22 acres. While Alternative 4 does not meet the full parkland requirement, it does provide 45 percent, which is similar to the 38 percent ratio provided in the Community Plan. New developments are required to either provide the required parkland commensurate with any increase in residents as part of their project or contribute to acquisition and development of parkland elsewhere within the community. While exact development details are not known at this time, it is anticipated that development could meet parkland requirements through a combination of on-site parks and contribution to acquisition and development of parkland elsewhere within the community.

Alternative 4 proposes land uses that would generate an additional 5,623 jobs which is an additional 129 percent of the growth contained in the Community Plan. While this is a significant addition, the proximity of OTC to the existing Old Town Transit Center, the projected growth in contractor support identified by NAVWAR, and the incorporation of residential makes this consistent with the regional planning policies and strategies and the transit-oriented development zone, but inconsistent with the Community Plan.

Alternative 4 proposes 1,890,000 square feet of nonresidential land uses (mainly office), which is 630 percent of the planned growth (300,000 square feet) in the Community Plan. While this degree of nonresidential growth is inconsistent with the Community Plan it is consistent with the regional planning policies and strategies and the transit-oriented development zone.

Alternative 4 is consistent with the military and regional plans. While Alternative 4 is consistent with the mix of land uses and transit-oriented development goals in the Midway-Pacific Highway Community Plan, the higher density of use is inconsistent with that allowed by the 30-foot Coastal Height Limit Overlay Zone that controls the non-federal land within the Community Plan. The increased density supported by the alternative development process described in Section 2.2, contributes to significant additional proposed growth in dwelling units, population, jobs, and nonresidential uses over the targets contained in the Community Plan. The inconsistency with the Community Plan land use densities would result in a significant impact relative to planned land use within the Midway-Pacific Highway Community Plan, although that plan may be updated in the future in light of the Navy's proposed mixed-use development and the removal of the 30-foot height limit in this area.

Mitigation Measures and Residual Impacts

Significant impacts would occur for this criterion, but no mitigation measures have been identified. Therefore, residual impacts are the same as the impacts described above.

REC-a: Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Construction

Less than significant impact. No permanent population increase that might increase the use of park facilities is anticipated during construction.

Operations

Less than significant impact. The increase in population associated with Alternative 4 would increase the use of existing neighborhood and regional parks or other recreational facilities. However, the Proposed Action would include open space areas that new population would likely, due to proximity, utilize as a first option for common activities such as exercise and dog-walking. The Proposed Action would likely also require the development to meet parkland requirements through a combination of on-site parks and contribution to acquisition and development of parkland elsewhere within the community. It is also likely that non-project-related population near the proposed development would utilize project-related open space and reduce their use of other public recreational facilities.

Mitigation Measures and Residual Impacts

While substantial physical deterioration of recreational facilities is not anticipated under Alternative 4, design elements included in project-related open space could consider including picnic/barbeque and other amenities that would further reduce use of other public facilities.

REC-b: Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?

Construction and Operations

Less than significant impact. The additional residents would increase the population-based park requirements for the community by another 40.22 acres under Alternative 4, 18.00 acres of which would be provided at OTC. This is based on the City's General Plan using the city's ratio of 2.8 acres of parkland for every 1,000 residents. The portion of parkland to be provided at OTC would be within the project footprint and would not have an adverse physical effect on the environment. The portion of parkland to be provided outside the OTC project footprint is currently unknown. Any new parkland developed would undergo the appropriate level of NEPA and/or CEQA analysis. In addition, the Navy and developers would work with the City of San Diego during the development process to meet the parks requirement. Therefore, it is assumed that additional recreational facilities developed outside the OTC project footprint as a result of the city's parkland planning factor would not have an adverse physical effect on the environment.

Mitigation Measures and Residual Impacts

Significant impacts would not occur for this criterion, so no mitigation measures are required. Therefore, there are no residual impacts.

AG-a: Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non- agricultural use?

AG-b: Conflict with existing zoning for agricultural use, or a Williamson Act contract?

AG-c: Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code Section 12220(g)), timberland (as defined by Public Resources Code Section 4526), or timberland zoned Timberland Production (as defined by Government Code Section 51104(g))?

AG-d: Result in the loss of forest land or conversion of forest land to non-forest use?

AG-e: Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest?

The preceding significance criteria are for agriculture and forestry resources. These resources do not occur in the project area or in the ROI. Therefore, no analysis is presented for criteria AG-a through AG-e, as there would be no impact to agriculture or forestry resources.

2.4.1.4 Alternative 5 Impacts

Construction and Operations

Less than significant impact. Alternative 5 would have the same impacts to physically dividing the community (LU-a) as described for Alternative 4. Alternative 5 would have similar impacts to Alternative 4 for conflicts with any land use plan, policy, or regulation (LU-b). The two alternatives are similar concepts, but the magnitude of proposed growth for Alternative 5 would be less (lower density development) than for Alternative 4 (higher density development). The dwelling unit component of Alternative 5 would represent an additional 63 percent of growth within the Midway-Pacific Highway Community Plan (see Table 2.4-2). The household population associated with Alternative 5 represents an additional 49 percent of growth within the Community Plan. This would increase the population-based park requirements by an additional 32.17 acres, of which 18.50 would be provided within the development. The anticipated jobs within Alternative 5 is 3,823 jobs, representing an additional 87 percent of new jobs anticipated within the Community Plan. The nonresidential square footage of Alternative 5 is 1,340,000 square feet which is representing an additional 447 percent of the planned 300,000 square feet in the Community Plan.

Significant impacts would occur for the LU-b criterion, but no mitigation measures have been identified. Therefore, residual impacts are the same as the impacts described above.

Agriculture and forestry resources do not occur in the project area or in the ROI. Therefore, no analysis is required for criteria AG-a through AG-e, as there would be no impact to agriculture or forestry resources.

2.4.2 Cumulative Impacts

2.4.2.1 Land Use

Description of Geographic Study Area

For Alternatives 4 and 5, the ROI consists of the Midway-Pacific Highway, Old Town, and Uptown community planning areas. The ROI also considers the land use potentially affected by the regional plans presented in EIS Table 4.3-1. There are no agricultural resources within the ROI.

Relevant Past, Present, and Future Actions

EIS Table 4.3-2 lists the reasonably foreseeable cumulative actions that might cumulatively affect land use within the ROI. The projects include construction and development projects. The identified military projects at OTC and Marine Corps Recruit Depot San Diego would all be consistent with existing land uses at their respective installations, and therefore are not considered in this analysis.

Management plans such as the San Diego General Plan, the community plans, or regional plans all have the potential to shift land use over time. Proposed and reasonably foreseeable projects, such as the expansion of the San Diego International Airport, the new Central Mobility Hub, improvements to Port of San Diego lands, the redevelopment of the Sports Arena, The Post project, and other large development projects (e.g., Riverwalk and University of California San Diego Long Range Development Plan) could also alter land uses in their vicinities.

As detailed in the Midway-Pacific Highway Community Plan and further demonstrated by several of the identified cumulative projects, the Midway-Pacific Highway area is poised for major redevelopment in the coming years. Collectively, these and other projects have the potential to alter the existing landscape of the area, irrespective of the Proposed Action Alternatives considered in this EIS. The following impacts discussion evaluates the potential for synergistic, or interactive impacts of the Proposed Action Alternatives and in particular, the larger cumulative projects and community plans.

Alternatives 4 and 5

Implementation of Alternatives 4 and 5 would be consistent with the types of current and future land use identified in the Midway-Pacific Highway, Old Town, and Uptown Community Plans, and other military, local, regional, and federal planning documents. Potential land use changes would be consistent with the broader planning goals and concepts within the San Diego General Plan, the goals of the Community Plans, and the identified cumulative projects. These goals and concepts include supporting critical housing needs, fostering the development of sustainable communities, and the development of residential and employment uses in proximity to transit.

The Midway-Pacific Highway Community Plan identifies OTC as Military Use as exclusive military use on the federal/Navy-owned property. The areas adjacent to OTC area planned as mixed-use with varying residential densities to complement the ongoing military use of the site. Other actions in the geographic extent, such as the Sports Arena redevelopment, the Post urban office complex, the San Diego International Airport Terminal 1 expansion, and the large commercial development projects would contribute to the level of potential future development contemplated by local plans.

Alternatives 4 and 5 would also provide additional improvements for the transportation efficiency objectives due to location of a transit center at the OTC location. This would improve local and regional transportation efficiency and would also create a transit efficiency solution for traffic to and from San Diego International Airport.

When combined with the cumulative projects, Alternatives 4 and 5 would also be consistent with the identified City of San Diego, Port of San Diego, San Diego International Airport, and SANDAG plans and programs, specifically providing support to the goals associated with transportation efficiency, air quality improvements, promotion of a healthy environment, strengthening of the economy, supporting thriving communities, proximity to transit, increasing the amount of available parkland, and application of a multimodal approach to improving circulation and access throughout the community. However, while the future plans, projects, and programs have the potential to be complementary and collectively beneficial to land use over time, due in large part to the major redevelopment and transportation projects proposed in the region and in combination with Alternatives 4 and 5, the overall land use changes and recreation goal shortfalls would represent a substantial deviation from existing conditions and future goals as outlined in current community plans. Therefore, when added to the impacts from the identified cumulative projects, there would be significant cumulative impacts on land use from implementation of Alternatives 4 or 5.

2.5 Population/Housing

The EIS Socioeconomics section discusses data related to population and demographics, employment and income, housing, economic activity, and government revenue to provide key insights into the socioeconomic conditions that might be affected by the proposed actions and provides results of impact analysis.

A description of regulatory setting, environmental setting, and assessment methodology are presented in Sections 3.5.1, 3.5.2, and 3.5.3 of the EIS, respectively.

2.5.1 Impacts Determination

2.5.1.1 Impacts Summary

Table 2.5-1 presents a summary of impacts related to population/housing for each criterion specified in CEQA Appendix G Environmental Checklist Form. Explanation of each impact conclusion is provided in the following subsections.

Table 2.5-1 Impacts Related to Population/Housing

Criteria	*Potentially Significant*	*Less than Significant with Mitigation*	*Less than Significant*	*No Impact*
XIV. POPULATION AND HOUSING (POP-) Would the project:	-	-	-	-
a) Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?	-	-	**X**	-
b) Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?	-	-	**X**	-

Legend: - = no data in cell; X = selection for Alternatives 4 and 5.

2.5.1.2 No Action/No Project Alternative Impacts

The impacts of No Action Alternative for population and housing are described in Section 3.5.3.1 of the EIS, *Socioeconomics*. The No Action Alternative would result in less than significant impacts to population and housing.

2.5.1.3 Alternative 4 Impacts

POP-a: Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?

Construction

Less than significant impact. The construction industry of San Diego County, with approximately 92,000 workers in the construction industry, and surrounding areas, is sufficient to supply the necessary workforce to complete construction projects without additional population relocating to the county; therefore, no permanent population increase is anticipated in association with construction for Alternative 4.

Operations

Less than significant impact. Under Alternative 4, an estimated 7,980 new housing units would become occupied with an additional 14,364 people added to county population. Population projections from SANDAG (2013) for the San Diego region (approximating San Diego County) indicate that from 2020 to 2050 the regional population would grow by nearly 1.0 million. The San Diego General Plan (City of San Diego, 2008) indicates a projected population increase for the City of San Diego, from 2020 to 2030, of approximately 134,000. While Alternative 4 would lead to the addition of substantial population, it would add only a fraction of that identified in plans and projections, and therefore would be consistent with plans, fulfilling goals rather than exceeding them.

Mitigation Measures and Residual Impacts

Significant impacts would not occur for this criterion, so no mitigation measures are required. Therefore, there are no residual impacts.

POP-b: Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?

Construction

Less than significant impact. The construction industry of San Diego County, with approximately 92,000 workers in the construction industry, and surrounding areas, is sufficient to supply the necessary workforce to complete construction projects without additional population relocating to the county; therefore, no permanent population increase that might displace current residents is anticipated under Alternative 4.

Operations

Less than significant impact. Developments under Alternative 4 would not be constructed on land that is currently used for housing, would add to the number of affordable units in the socioeconomic ROI, and would not be likely to reduce affordability in low-income areas; therefore, no displacement is anticipated (see Section 4.2.3.3 in the EIS Appendix G).

Mitigation Measures and Residual Impacts

Significant impacts would not occur for this criterion, so no mitigation measures are required. Therefore, there are no residual impacts.

2.5.1.4 Alternative 5 Impacts

POP-a: Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?

Construction

Less than significant impact. The construction industry of San Diego County, with approximately 92,000 workers in the construction industry, and surrounding areas, is sufficient to supply the necessary workforce to complete construction projects without additional population relocating to the county; therefore, no permanent population increase is anticipated in association with construction for Alternative 5.

Operations

Less than significant impact. Under Alternative 5, an estimated 6,384 new housing units would become occupied with an additional 11,491 people added to county population. Population projections from SANDAG (2013) for the San Diego region (approximating San Diego County) indicate that from 2020 to 2050 the regional population would grow by nearly 1.0 million. The San Diego General Plan (City of San Diego, 2008) indicates a projected population increase for the City of San Diego, from 2020 to 2030, of approximately 134,000. While Alternative 5 would lead to the addition of substantial population, it would add only a fraction of that identified in plans and projections, and therefore would be consistent with plans, fulfilling goals rather than exceeding them.

Mitigation Measures and Residual Impacts

Significant impacts would not occur for this criterion, so no mitigation measures are required. Therefore, there are no residual impacts.

POP-b: Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?

Construction

Less than significant impact. The construction industry of San Diego County, with approximately 92,000 workers in the construction industry, and surrounding areas, is sufficient to supply the necessary workforce to complete construction projects without additional population relocating to the county; therefore, no permanent population increase that might displace current residents is anticipated under Alternative 5.

Operations

Less than significant impact. Developments under Alternative 5 would not be constructed on land that is currently used for housing, would add to the number of affordable units in the socioeconomic ROI, and would not be likely to reduce affordability in low-income areas; therefore, no displacement is anticipated (see Section 4.2.3.3 in the EIS Appendix G).

Mitigation Measures and Residual Impacts

Significant impacts would not occur for this criterion, so no mitigation measures are required. Therefore, there are no residual impacts.

2.5.2 Cumulative Impacts

Alternative 4 would induce a population increase of 14,364 people and Alternative 5 would induce a population increase of 11,491 people through the development of new housing units. Under both alternatives, the estimated population growth fits within parameters of population projections. Continued development of residential housing and multi-family units throughout San Diego County would also contribute to population growth over time. The overall population growth, however, is consistent with planning goals and expectations; therefore, the impact would be less than significant.

Neither Alternative 4 or Alternative 5 would displace any existing people or housing. The SANDAG 2050 RTP indicates that elements of that plan would lead to the displacement of people, housing, and businesses; the plan identifies this situation as a significant impact. The large scale of the SANDAG 2050 RTP, and the substantial displacement associated with it, indicates that there would be a significant cumulative impact related to displacement.

2.6 Cultural Resources and Tribal Cultural Resources

This section addresses both cultural resources (historical resources, archaeological resources, and human remains) and tribal cultural resources (something of cultural value to a California Native American tribe). Historical resources are recognized as part of the environment under CEQA section 15064.5 *Determining the Significance of Impacts to Archaeological and Historical Resources.* CEQA defines historical resources as any object, building, structure, site, area, place, record, or manuscript which a lead agency determines to be historically significant or significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California.

A description of regulatory setting, environmental setting, and assessment methodology are presented in Sections 3.6.1, 3.6.2, and 3.6.3 of the EIS.

2.6.1 Impacts Determination

2.6.1.1 Impacts Summary

Table 2.6-1 presents a summary of impacts related to cultural and tribal resources for each criterion specified in CEQA Appendix G Environmental Checklist Form. Explanation of each impact conclusion is provided in the following subsections.

Table 2.6-1 Impacts Related to Cultural and Tribal Resources

Criteria	*Potentially Significant*	*Less than Significant with Mitigation*	*Less than Significant*	*No Impact*
V. CULTURAL RESOURCES (CUL-) Would the project:	-	-	-	-
a) Cause a substantial adverse change in the significance of a historical resource pursuant to § 15064.5?	**X**	-	-	-
b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?	-	-	**X**	-
c) Disturb any human remains, including those interred outside of dedicated cemeteries?	-	-	**X**	-
XVIII. TRIBAL CULTURAL RESOURCES (TRIBAL-) Would the project:	-	-	-	-
a) Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code § 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:	-	-	-	-
i. Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k), or	-	**X***	-	-
ii. A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code § 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code § 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.	-	**X***	-	-

Legend: - = no data in cell; X = selection for Alternatives 4 and 5.

Note: *Impacts may be reduced to less than significant impact after mitigation measures are determined through consultation with the State Historic Preservation Officer and other interested parties.

2.6.1.2 No Action/No Project Alternative Impacts

The impacts of No Action Alternative for cultural resources and tribal cultural resources are described in Section 3.6.6.1 of the EIS, *Cultural Resources*. The No Action Alternative would result in no impacts to cultural resources and tribal cultural resources.

2.6.1.3 Alternative 4 Impacts

CUL-a: Cause a substantial adverse change in the significance of a historical resource pursuant to section 15064.5?

Substantial adverse change includes demolition, destruction, relocation, or alteration such that the significance of an historical resource would be impaired. While demolition and destruction create significant impacts, it is more difficult to assess when change, alteration, or relocation crosses the threshold of substantial adverse change. CEQA Guidelines provide that a project that demolishes or alters those physical characteristics of an historical resource that convey its historical significance (i.e., its character-defining features) can be considered to materially impair the resource's significance.

Potentially Significant impacts. The Consolidated Aircraft Plant 2 Historic District is located within OTC Site 1. Construction of Alternative 4 would result in the demolition of all contributing resources of the Consolidated Aircraft Plant 2 Historic District. Alternative 4 would therefore impair the significance of the historical resource to the extent that it would result in loss of California Register of Historical Resources (CRHR) eligibility for the Consolidated Aircraft Plant 2 Historic District. Proposed construction under Alternative 4 includes 51 mid-rise (9 to 21 floors) and 35 high-rise (22+ floors) buildings that would introduce visual elements that are out of character for 19 historical resources (CRHR eligible) located within 0.5 mile of the project sites, and this change would alter their setting (Table 2.6-2 and Figure 3.6-4 in the EIS) (see the EIS Appendix H for detailed analysis). Two of those historical resources, Casa de Estudillo and San Diego Presidio, are also designated National Historic Landmarks.

Table 2.6-2 Historical Resources within the Area of Potential Impacts with Adverse Impacts

Address	*Historic Name*	*Year*	*SHPO Status Code**
Consolidated Aircraft Plant 2 Historic District	Consolidated Aircraft Plant 2 Historic District	1941	3D
Marine Corps Recruit Depot	Marine Corps Recruit Depot		1D
4016 Wallace Street (Old Town State Park)	Old Town San Diego State Historic Park	1821	1
2612 San Diego Avenue (Old Town State Park)	San Diego Union Office	1850	1D
2616 San Diego Avenue (Old Town State Park)	Pedporena Adobe	1869	1CS; 5D1
2724 Congress Street (Old Town State Park)	Casa de Machadnueo-Stewart	1830	1CS; 5D1
2731 San Diego Avenue (Old Town State Park)	San Diego Courthouse	1847	1D
2733 San Diego Avenue (Old Town State Park)	Colorado House	1851	1D
2737 San Diego Avenue (Old Town State Park)	Casa de Rodriguez	1830s	2D
2740 San Diego Avenue (Old Town State Park)	Plaza; San Diego Viejo; Washington Square	-	1D
2741 San Diego Avenue (Old Town State Park)	Casa de Machado	1835	1CS; 5D1
3966 Mason Street (Old Town State Park)	Mason Street School	1865	1CS; 5D1
4000 Mason Street (Old Town State Park)	Casa de Estudillo (NHL)	1828	1CS; 5D1
4000 Wallace Street (Old Town State Park)	Rose-Robinson Adobe Reconstruction	-	2D2
2293 San Juan Road	William Mason Fortesque	1955	5S2

Address	Historic Name	Year	SHPO Status Code*
	Residence		
2660 Calhoun Street (Old Town State Park)	Casa de Bandini	1829	1CS; 5D1
2727 Presidio Drive	San Diego Presidio (NHL)	1769	1S
3890 Twiggs Street	Casa Larga	1835	1CS; 5S1
2495 Jefferson Street (Survey)	2495 Jefferson Street	c.1927	5S3
Northwest Mission Hills Historic District (Survey)	Northwest Mission Hills Historic District	1908-1950	5D3

Legend: NHL = National Historic Landmark; NRHP = National Register of Historic Places; SHPO = State Historic Preservation Officer; Survey = Community Plan Area survey for either Old Town or Uptown.

Notes: * California Historical Resource Status Codes, defined at https://ohp.parks.ca.gov/pages/1069/files/chrstatus%20codes.pdf and https://ohp.parks.ca.gov/pages/1069/files/tab8.pdf

NRHP, CRHR, and local eligibility are indicated by codes that include:

NRHP eligible: 1, 1D, 1S, 2D, 2D2,

CRHR listed: 1CS, 1D, 1S, 2D, 2D2,

Locally eligible: codes that begin with 5.

Thirteen of the 19 resources are in Old Town State Historic Park, including the Casa de Estudillo. Views from Old Town State Historic Park toward the project sites, including the central plaza, are among the most impacted. Outside of the Old Town State Historic Park, the new construction would be clearly visible from San Diego Presidio, Casa Larga, William Mason Fortesque Residence, 2495 Jefferson Street, Marine Corps Recruit Depot, and Northwest Mission Hills Historic District. In particular, the impacted view is a character-defining feature of the Fortesque Residence, Northwest Mission Hills Historic District, and the San Diego Presidio because it directly relates to the historical significance of the resource.

Overall, the mass, scale, and height, as well as the contrast of the new construction, would be an incompatible change to the setting and views of these 19 historical resources. Therefore, implementation of Alternative 4 would result in extensive alterations to the setting of 19 historical resources (CRHR eligible), two of which are also National Historic Landmarks (Table 2.6-2).

As such, implementation of Alternative 4 would result in alterations such that the significance of historical resources would be impaired and therefore a substantial adverse change in the significance of historical resources and potentially significant impacts pursuant to section 15064.5.

No impact. Portions of La Playa Trail (P-37-028552) are located within the project sites. La Playa Trail consists of several historic public streets (Midway Drive between Rosecrans Street and Barnett Avenue; Enterprise Street between Midway Drive and Sports Arena Boulevard; and Rosecrans Street between Nimitz Boulevard and Pacific Highway). Alternative 4 would not change any of the associated historic public streets and, therefore, would not impact La Playa Trail.

No impact. After construction, the project sites would contain a NAVWAR facility along with a combination of mixed-use residential, office, hotel, and retail space. Proposed operations would have no impact on historical resources, especially after the proposed demolition of the contributing resources of the Consolidated Aircraft Plant 2 Historic District renders the district ineligible.

Mitigation Measures and Residual Impacts

Alternative 4 would result in potentially significant impacts to the Consolidated Aircraft Plant 2 Historic District and 19 additional nearby historical resources. Navy will develop measures to avoid, minimize or mitigate adverse effects on historic properties in consultation with the State Historic Preservation Officer (SHPO), Advisory Council on Historic Preservation, federally recognized Indian tribes, and other consulting parties. Mitigation measures defined through consultation may reduce impacts to less than significant.

Residual impact. The substantial adverse change in the significance of 20 historical resources would be lessened by the mitigation developed in consultation with SHPO but may not be lowered to a less than significant impact under CEQA. Therefore, even with mitigation, demolition of the Consolidated Aircraft Plant 2 Historic District and the extensive alterations to the setting of 19 other historical resources would remain a significant impact under Alternative 4.

CUL-b: Cause a substantial adverse change in the significance of an archaeological resource pursuant to section 15064.5?

It is possible that utilities may extend outside OTC Site 1 and OTC Site 2 within adjacent easements, but the location and extent of associated ground disturbance is not known at this time. Once future utility plans are identified for areas outside the project site, further analysis would be needed to determine if utility plans could result in a substantial adverse change under CEQA.

Less than significant. Under Alternative 4, proposed construction activities would result in ground disturbance at OTC Site 1 and OTC Site 2. There are no identified archaeological resources within these areas. Additionally, based on available geological data for these areas, there is low potential for buried unrecorded archaeological resources within the project site. To reduce the risk of damage to unknown archaeological sites, the Navy will develop an archaeological monitoring plan in consultation with SHPO and federally recognized Indian tribes. If an archaeological site was discovered during construction, the Navy would follow regulations for post-review discoveries, per 36 Code of Federal Regulations 800.13. As such, Navy and their contractors would avoid or minimize harm to unanticipated discoveries and stop work in the vicinity of the discovery until Navy concludes consultation with SHPO and federally recognized Indian tribes regarding the discovery. As such, there would be no substantial adverse change in the significance of an archaeological resource pursuant to section 15064.5 and less than significant impacts to archaeological resources from proposed construction under Alternative 4.

No impact. Under Alternative 4, operations would not involve ground disturbance, and therefore would have no effect on archaeological resources. There would be no substantial adverse change in the significance of an archaeological resource pursuant to section 15064.5 and no impacts to archaeological resources from proposed operations under Alternative 4.

Mitigation Measures and Residual Impacts

Significant impacts would not occur for this criterion, so no mitigation measures are required. Therefore, residual impacts are the same as the impacts described above.

CUL-c: Disturb any human remains, including those interred outside of dedicated cemeteries?

Less than significant. Under Alternative 4, proposed construction activities would result in ground disturbance at OTC Site 1 and OTC Site 2. There are no known human remains located within these areas. Additionally, based on available geological data and past development, there is low potential for unanticipated discovery of human remains, and therefore a low likelihood that such resources would be affected during construction. With standard operating procedures in place for inadvertent discoveries during construction activities, human remains would not be disturbed and there would be less than significant impacts from proposed construction under Alternative 4.

No impact. Under Alternative 4, operations would not involve ground disturbance. Therefore, operations would not disturb human remains, and no impacts would occur from proposed operations under Alternative 4.

Mitigation Measures and Residual Impacts

Significant impacts would not occur for this criterion, so no mitigation measures are required. Therefore, residual impacts are the same as the impacts described above.

TRIBAL-a: Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:

i. **Listed or eligible for listing in the CRHR, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k)**

Navy conducted inventories of cultural resources at the Navy OTC to identify properties that are listed or potentially eligible for listing in the National Register of Historic Places, including a California Historical Resources Information System record search and a review of recorded resources and prior inventories. A request was sent to the California Native American Heritage Commission to search their Sacred Lands File to determine whether their files contain any information relating to the presence of tribal cultural resources within the Alternative 4 area. The Native American Heritage Commission responded stating that the record search indicated the presence of Native American cultural resources in or within the vicinity of the Alternative 4 area (see EIS Appendix F and Attachment C). As part of the Section 106 consultation process, the Navy will consult with federally recognized Indian tribes to identify historic properties of traditional religious and cultural importance to them that may be affected by the Proposed Action.

Mitigation Measures and Residual Impacts

Navy will develop measures to avoid, minimize or mitigate adverse effects on archaeological resources in consultation with the SHPO and federally recognized Indian tribes .

Residual impact. Impacts would be lessened by the mitigation developed in consultation with SHPO and may be lowered to a less than significant impact under CEQA.

ii. **A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.**

A request was sent to the California Native American Heritage Commission to search their Sacred Lands File to determine whether their files contain any information relating to the presence of tribal cultural resources within the Alternative 4 area. The Native American Heritage Commission responded stating that the record search indicated the presence of Native American cultural resources in or within the vicinity of the Alternative 4 area (see EIS Appendix F and Attachment C). As part of the Section 106 consultation process, the Navy will consult with federally recognized Indian tribes to identify historic properties of traditional religious and cultural importance to them that may be affected by the Proposed Action.

Mitigation Measures and Residual Impacts

Navy will develop measures to avoid, minimize or mitigate adverse effects on significant resources in consultation with the SHPO and federally recognized Indian tribes.

Residual impact. Impacts would be lessened by the mitigation developed in consultation with SHPO and federally recognized Indian tribes and may be lowered to a less than significant impact under CEQA.

2.6.1.4 Alternative 5 Impacts

Construction and Operations

Construction and operational impacts for Alternative 5 are similar to Alternative 4. Implementation of Alternative 5 would result in loss of CRHR eligibility for the Consolidated Aircraft Plant 2 Historic District. Overall, the mass, scale, and height, as well as the contrast of the new construction, would be an incompatible change to the setting and views of 19 historical resources (CRHR eligible). Therefore, implementation of Alternative 5 would result in extensive alterations to the setting of 20 historical resources, two of which are also National Historic Landmarks. As such, implementation of Alternative 5 would result in alterations such that the significance of historical resources would be impaired and therefore a substantial adverse change in the significance of historical resources and potentially significant impacts pursuant to section 15064.5 (see Section 2.6.1.3 for discussion of similar impacts). Alternative 5 would have no impact or less than significant impacts for the other significance criteria for cultural resources, as described under Alternative 4.

Mitigation Measures and Residual Impacts

Alternative 5 would result in potentially significant impacts to the Consolidated Aircraft Plant 2 Historic District and 19 additional nearby historical resources. Navy will develop measures to avoid, minimize or mitigate adverse effects on historic properties in consultation with the SHPO, Advisory Council on Historic Preservation, federally recognized Indian tribes, and other consulting parties. Mitigation measures defined through consultation may reduce impacts to less than significant.

Residual Impact. The substantial adverse change in the significance of 20 historical resources would be lessened by the mitigation developed in consultation with SHPO, Advisory Council on Historic Preservation, federally recognized Indian tribes, and other consulting parties but may not be lowered to a less than significant impact under CEQA. Therefore, even with mitigation, demolition of the Consolidated Aircraft Plant 2 Historic District and the extensive alterations to the setting of 19 other historical resources would remain a significant impact under Alternative 5.

2.6.2 Cumulative Impacts

2.6.2.1 Description of Geographic Study Area

The ROI for evaluating cumulative impacts on cultural resources is defined as the project site and adjacent communities (i.e., the Midway-Pacific Highway, Old Town, and Uptown communities). This area includes a 0.5-mile radius from the project site to ensure adequate consideration of visual impacts. Cultural resources are unique as well as finite in nature, so that an impact on a historical resource within the ROI may contribute to a cumulative impact.

2.6.2.2 Relevant Past, Present, and Future Actions

EIS Table 4.3-2 identifies those past, present, and reasonably foreseeable future projects that have the most potential to contribute to cumulative cultural resource effects when combined with the Proposed Action Alternatives.

Although the ROI has been subject to extensive development, the cultural sensitivity for the area is still considered moderate. California Historical Resources Information System records indicate the presence of 184 previously recorded cultural resources, consisting of historic archaeological and architectural resources, within a half-mile radius of the project site. Numerous projects listed in EIS Table 4.3-2 have the potential to impact cultural resources, especially the various transportation improvement projects (SANDAG, San Diego International Airport) and redevelopment projects (Port of San Diego, Sport Arena Redevelopment) that include substantial ground disturbance and redevelopment. In general, construction-related ground disturbance has the potential to impact archaeological sites and traditional cultural resources, while building demolition, renovation, or changes in important viewsheds may affect historic buildings.

2.6.2.3 Alternatives 4 and 5

Implementation of Alternatives 4 or 5 would result in loss of CRHR eligibility for the Consolidated Aircraft Plant 2 Historic District. Additionally, the mass, scale, and height, as well as the contrast of the new construction, would be an incompatible change to the setting and views of 19 historical resources (CRHR eligible). Therefore, implementation of Alternatives 4 or 5 would result in extensive alterations to the setting of 20 historical resources, two of which are also National Historic Landmarks. As such, implementation of Alternatives 4 or 5 would result in alterations such that the significance of historical resources would be impaired and therefore a substantial adverse change in the significance of historical resources and potentially significant impacts pursuant to section 15064.5. The substantial adverse change in the significance of 20 historical resources would be lessened by the mitigation developed in consultation with SHPO but may not be lowered to a less than significant impact under CEQA.

Given the history and cultural importance of the ROI, notably historical resources such as the Old Town San Diego State Historic Park, Presidio Park, and Casa de Lopez, many of the identified present and foreseeable future cumulative projects are anticipated to have the potential to affect historical resources. The cultural measures contained in the Old Town Community Plan and the Midway-Pacific Highway Community Plan would also be relevant for the identified cumulative projects. If cumulative projects are within or near historically significant buildings, constructing such projects may damage or alter those resources and diminish their integrity.

None of the other reasonably foreseeable projects would impact the Consolidated Aircraft Plant 2 Historic District. While the demolition of the Consolidated Aircraft Plant 2 Historic District would remove the only remaining example of this type of historical resource within San Diego County, the Navy will develop measures to avoid, minimize, or mitigate adverse effects on historic properties in consultation with SHPO, Advisory Council on Historic Preservation, federally recognized Indian tribes, and other consulting parties. The Navy will also continue to manage cultural resources under their jurisdiction in accordance with applicable federal law and Navy policy.

Impacts from some of the listed past, present, and reasonably foreseeable future projects could overlap with impacts on the other 19 historic resources whose setting would be altered by Alternatives 4 and 5. The listed projects with the potential for significant impacts on cultural resources have been or will be evaluated under NEPA and/or CEQA, including consultations with regulatory agencies and stakeholders, such as the City of San Diego, Save our Heritage Organization, SHPO, and tribal governments, and the subsequent implementation of mitigation measures, as warranted. Even with mitigation, implementation of Alternatives 4 or 5 when combined with the past, present, and reasonably foreseeable future projects could result in potentially significant cumulative impacts to cultural resources.

2.7 Hazards and Hazardous Materials (Hazardous Materials and Wastes)

Hazardous materials are any materials that, because of its quantity, concentration, or physical or chemical characteristics, poses a significant present or potential hazard to human health and safety or to the environment if released into the workplace or the environment. Hazardous wastes are solid wastes that meet the hazardous materials definition. A description of regulatory setting, environmental setting, and assessment methodology are presented in Sections 3.7.1, 3.7.2, and 3.7.3 of the EIS, respectively.

2.7.1 Impacts Determination

Impacts resulting from hazardous materials and wastes are determined by applying the significance criteria to the potential changes in hazardous materials and wastes (e.g., types, volumes, processes, and management) that result from the alternatives.

2.7.1.1 Impacts Summary

Table 2.7-1 presents a summary of impacts related to hazards and hazardous materials for each criterion specified in CEQA Appendix G Environmental Checklist Form. Explanation of each impact conclusion is provided in the following subsections.

Table 2.7-1 Impacts Related to Hazards and Hazardous Materials

Criteria	*Potentially Significant*	*Less than Significant with Mitigation*	*Less than Significant*	*No Impact*
IX. HAZARDS AND HAZARDOUS MATERIALS (HW-) Would the project:	-	-	-	-
a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?	-	-	**X**	-
b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?	-	-	**X**	-
c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?	-	-	-	**X**
d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code § 65962.5 and, as a result, would it create a significant hazard to the public or the environment?	-	-	-	**X**
e) For a project located within an airport land use plan or, where such a plan has not been adopted, within 2 miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?	-	-	**X**	-

Criteria	Potentially Significant	Less than Significant with Mitigation	Less than Significant	No Impact
f) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?	-	-	-	**X**
g) Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires?	-	-	-	**X**

Legend: - = no data in cell; X = selection for Alternatives 4 and 5.

2.7.1.2 No Action/No Project Alternative Impacts

The impacts of the No Action Alternative for hazards and hazardous materials are described in Section 3.7.3.1 of the EIS, *Hazardous Materials and Wastes*. The No Action Alternative would result in less than significant impacts with respect to hazards and hazardous materials.

2.7.1.3 Alternative 4 Impacts

HW-a: Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Construction

Less than significant impact. Building demolition and construction would use normal demolition and construction methods, which would limit the use of hazardous materials. Over the construction period, hazardous materials and petroleum substances would be used and stored at OTC to support demolition and construction activities. For example, fuels (e.g., diesel, gasoline) would be required to run equipment. In addition, paints, adhesives, and solvents would be used during construction activities. These materials would be stored in proper containers, employing secondary containment as necessary to prevent and limit spills. The routine use, transport, and disposal of these common hazardous materials would not create a significant hazard to the public or environment.

Operations

Less than significant impact. Hazardous materials management at would be similar to current management practices, however with the relocation of some laboratory, warehouse and storage space, there would be reductions in materials used for electronics maintenance, painting, and blasting. The types, amounts, and processes that use hazardous materials used by NAVWAR would be the same. Current management practices would continue. All contingency and spill plans would be updated accordingly. Management of any hazardous materials used by the transit center, residential, hotel, office, and retail functions planned under this alternative would be the responsibility of each tenant as specified in public-private development agreements. Hazardous materials used by these tenants are likely to consist of cleaners, paints, solvents, adhesives, lubricating oils, etc. These common hazardous materials used by these organizations would not create a significant hazard to the public or environment.

Mitigation Measures and Residual Impacts

Significant impacts would not occur for this criterion, so no mitigation measures are required. Therefore, there would be no residual impacts.

HW-b: Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Construction

Less than significant impact. Volumes and types of materials used in the demolition and construction activities would not be of amounts that would create a significant hazard to the public or environment from an accident. These materials would be stored in proper containers, employing secondary containment as necessary to prevent and limit spills. Any spills or releases would be confined to the work site and responded to upon discovery of spill to minimize impacts.

Operations

Less than significant impact. Hazardous materials management would be similar to current management practices, however with the relocation of some laboratory, warehouse and storage space, there would be reductions in materials used for electronics maintenance, painting, and blasting. Current management practices would continue. All contingency and spill plans would be updated accordingly.

The management of any hazardous materials used by the transit, residential, hotel, office, and retail functions planned under this alternative would be the responsibility of each tenant as specified in public-private partner agreements. Volumes and types of materials used would not create a significant hazard to the public or environment on the result of an upset or accident.

Mitigation Measures and Residual Impacts

Significant impacts would not occur for this criterion, so no mitigation measures are required. Therefore, there would be no residual impacts.

HW-c: Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Construction

No impact. OTC is located within 0.25 miles of the High Virtual Academy and the Fremont Elementary School. Hazardous materials substances and wastes would be the same as those described for HW-b. Due to the distance to the schools and the types and volumes of materials handled there would be no impact from the handling of hazardous materials at the project site to the schools.

Operations

No impact. All hazardous materials and wastes would be similar to those used and generated for present operations and would be managed in accordance with existing protocols. Due to the distance to the schools and the types and volumes of materials handled there would be no impact from the handling of hazardous materials at the project site to the schools.

Mitigation Measures and Residual Impacts

Impacts would not occur for this criterion, so no mitigation measures are required. Therefore, there are no residual impacts.

HW-d: Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code § 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Construction and Operations

No impact. OTC is not located on a site listed pursuant to Government Code §65962.5 as verified by a review of the lists provided at https://calepa.ca.gov/SiteCleanup/CorteseList/.

Mitigation Measures and Residual Impacts

Impacts would not occur for this criterion, so no mitigation measures are required. Therefore, there are no residual impacts.

HW-e: For a project located within an airport land use plan or, where such a plan has not been adopted, within 2 miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?

Construction and Operations

Less than significant impact. OTC is located within 2 miles of the San Diego International Airport. However, OTC is not located within a designated airport safety compatibility zone (San Diego County Regional Airport Authority, 2014). Nevertheless, redevelopment at OTC has the potential to affect airspace if there is a change to building heights (as proposed under Alternatives 4 and 5). Implementation of Alternatives 4 or 5 will require Federal Aviation Administration (FAA) review in accordance with 14 Code of Federal Regulations part 77. It is assumed that FAA approval is required under these regulations to avoid airspace conflicts. Therefore, the basis of the impact analysis for Alternatives 4 and 5 assume that this FAA review and approval occurs and that the proposed building heights are acceptable to the FAA. If FAA determines the selected alternative would conflict with FAA airspace requirements, the developer would work with the FAA and modify the design within the parameters of the EIS analysis.

The majority of OTC Site 1 is located outside of the 60 decibel (dB) Community Noise Equivalent Level (CNEL) noise contour, and the southern portion of OTC Site 2 is located between the 60-65 dB contours, as shown in Figure 3.13-2 of the EIS. No noise level reductions are prescribed by the Airport Land Use Compatibility Plan for commercial, office, service, or transient lodging uses within areas that experience 60-65 dB CNEL. The Airport Land Use Compatibility Plan would require noise sensitive uses, such as residential use, to not exceed interior levels of 45 dB CNEL. OTC is federal government/Navy-owned land and is thus exempted from Airport Land Use Compatibility Plan requirements. As such, the Navy would not require developers to follow noise level reduction guidelines of 20 dB for noise sensitive uses such as residences, as prescribed in the Airport Land Use Compatibility Plan, to meet the interior 45 dB CNEL level. However, typical new construction projects meeting current energy guidelines (such as recommendations on insulation or window types) often exceed noise level reductions necessary to reach the target interior noise levels specified by the Airport Land Use Compatibility Plan. Therefore, the risk that future noise sensitive uses such as residences would be negatively impacted by aircraft noise is relatively low. Based on the analysis presented above, there would be no safety hazard and a very low risk of a noise hazard related to air traffic for people working or residing in the project area. Therefore, there would be a less than significant impact related to this criterion. For a discussion of noise generated from the alternatives, refer to EIS Section 3.13, *Noise* and impact criterion NOI-c.

Mitigation Measures and Residual Impacts

Impacts would not occur for this criterion, so no mitigation measures are required. Therefore, there are no residual impacts.

HW-f: Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Construction and Operations

No impact. OTC is not part of a city or state-adopted emergency response plan or emergency evacuation plan. Construction (including construction staging) and operational activities would occur within the existing project site footprint; therefore, no public streets or potential public evacuation routes will be impacted.

Mitigation Measures and Residual Impacts

Impacts would not occur for this criterion, so no mitigation measures are required. Therefore, there are no residual impacts.

HW-g: Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires?

Construction and Operations

No impact. OTC is located in a highly urbanized environment and is well removed from wildlands. The nearest fire hazard zone is located to the east, approximately 0.3 miles away and is separated from that zone by Interstate 5 and urban development (Ready San Diego, 2020).

Mitigation Measures and Residual Impacts

Impacts would not occur for this criterion, so no mitigation measures are required. Therefore, there are no residual impacts.

2.7.1.4 Alternative 5 Impacts

Construction and Operations

Impacts determinations for hazards and hazardous materials under Alternative 5 would be identical to those under Alternative 4. Therefore, Alternative 5 would have no impacts or less than significant impacts for each of the significance criteria for hazards and hazardous materials.

Mitigation Measures and Residual Impacts

Impact avoidance and standard minimization design features would lessen any potential impacts from hazards and hazardous materials to less than significant levels. Significant impacts would not occur for this criterion, so no mitigation measures are required. Therefore, there are no residual impacts.

2.7.2 Cumulative Impacts

2.7.2.1 Hazardous Materials and Waste

Description of Geographic Study Area

The ROI for hazardous materials and hazardous and solid wastes corresponds to OTC, adjacent properties, and regional waste disposal/recycling locations. This ROI thus considers the use of hazardous materials and wastes at and adjacent to OTC, existing Installation Restoration sites at OTC, known off-

OTC contamination/remediation sites adjacent to OTC, and local landfills and recycling locations that would serve OTC and the identified cumulative projects.

Relevant Past, Present, and Future Actions

Table 4.3-2 in the EIS identifies those past, present, and reasonably foreseeable future projects that have the most potential to contribute to cumulative hazardous materials and waste effects when combined with the Proposed Action Alternatives. The alternatives involve varying degrees of development and activities that would properly use necessary hazardous materials (e.g., petroleum products, metals), generate and manage hazardous waste, generate demolition and construction debris, and generate municipal solid waste during operations. The list of projects also includes ongoing remediation and cleanup projects.

Examples of such projects include projects at the Port of San Diego, Marine Corps Recruit Depot San Diego, construction of the ITC, the San Diego International Airport Development Plan, the Navy Broadway Complex/Manchester Gateway Development Project, the Post, and the Sports Arena redevelopment. Other projects include the Hacienda Heights Apartments project and the construction of three Liberty Station hotels. Other projects that have a potential to affect this resource area are related to investigations/remediation of existing contamination sites. These include remediation of OTC Installation Restoration Sites 1, 10, and 11 and suspected areas of per- and poly-fluoroalkyl substances (commonly referred to as PFAS) contamination, as well as the cleanup of two nearby off-installation hazardous wastes sites.

Alternatives 4 and 5

No cumulative impacts for CEQA criteria HW-c, HW-d, HW-f, and HW-g would occur because implementation of either Alternative 4 or 5 would not result in impacts under these criteria. Alternatives 4 and 5 result in less than significant impacts for HW-a, HW-b, and HW-e and therefore these criteria carried forward for cumulative analysis.

Under criterion HW-a (Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?) impacts associated with Alternatives 4 and 5 combined with the relevant past, present, and future actions identified in EIS Table 4.3-2 would not be expected to result in significant impacts. Unusual or exotic hazardous materials are not likely to be transported, used, or disposed. Hazardous materials would likely consist of paints, adhesives, solvents, cleaners, lubricating oils, etc. These materials would not be expected in amounts that would create a significant hazard and would be stored and used in geographically separate locations. Hazardous materials resulting from the cleanup of contaminated sites would be handled in accordance with all applicable regulations and would result in an overall beneficial impact once cleanup is completed.

Under criterion HW-b (Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?) impacts associated with Alternatives 4 and 5 combined with the relevant past, present, and future actions identified in EIS Table 4.3-2 would not be expected to result in significant impacts. As noted above these materials would be used and stored in geographically separate locations. Therefore, incidents at any one location would be isolated from hazardous materials at other locations.

Under criterion HW-e (For a project located within an airport land use plan or, where such a plan has not been adopted, within 2 miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?) impacts associated with

Alternatives 4 and 5 combined with the relevant past, present, and future actions identified in Table 4.3-2 would not be expected to result in cumulative impacts. The OTC is located outside of all designated airport safety compatibility zones, therefore, there would be no cumulative safety impacts. Numerous cumulative projects would be located within San Diego International Airport Noise Zones, however Alternatives 4 and 5 would not result in noise related to air traffic. For a discussion of cumulative noise generated from the alternatives and the identified cumulative projects, see Section 3.13, *Noise* and impact criterion NOI-c.

2.8 Wildfire (Public Health and Safety)

A wildland fire is any non-structure fire that occurs in areas of vegetation or natural fuels and can be either a prescribed fire or wildfire. Wildland fire occurs when vegetation, or "fuel," such as grass, leaf litter, trees, or shrubs, is exposed to an ignition source and the conditions for combustion are met, resulting in fire growth, and spread through adjacent combustible material. Wildland fires are either ignited by lightning or by some consequence of human activity.

A description of the ROI, approach to analysis, regulatory setting, and affected environment are presented in Sections 3.8.1.1, 3.8.1.2, 3.8.1.3, and 3.8.1.4 of the EIS, respectively.

2.8.1 Impacts Determination

2.8.1.1 Impacts Summary

Table 2.8-1 presents a summary of impacts related to wildfire for each criterion specified in CEQA Appendix G Environmental Checklist Form. Explanation of each impact conclusion is provided in the following subsections.

Table 2.8-1 Impacts Related to Wildfire

Criteria	*Potentially Significant*	*Less than Significant with Mitigation*	*Less than Significant*	*No Impact*
XX. WILDFIRE (WF-) Would the project:	-	-	-	-
a) Substantially impair an adopted emergency response plan or emergency evacuation plan?	-	-	**X**	-
b) Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?	-	-	-	**X**
c) Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?	-	-	**X**	-
d) Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?	-	-	-	**X**

Legend: - = no data in cell; X = selection for Alternatives 4 and 5.

2.8.1.2 No Action/No Project Alternative Impacts

The impacts of No Action Alternative for wildfire are described in Section 3.8.3.1 of the EIS, *Public Health and Safety*. The No Action Alternative would result in less than significant wildfire impacts.

2.8.1.3 Alternative 4 Impacts

WF-a: Substantially impair an adopted emergency response plan or emergency evacuation plan?

Construction and Operations

Less than significant impact. OTC is not part of a city or state-adopted emergency response plan or emergency evacuation plan. Construction (including construction staging) and operation activities would occur within the existing OTC footprint. Implementation of Alternative 4 would bring an influx of users, occupants, and residents to OTC and the surrounding area. Additional police, fire, and first responders would be needed to maintain current levels of service for all emergencies (including wildfires) in the project area. However, the costs associated with additional public service resources would be covered by the additional tax revenues and pertinent development impact fees. Future community, emergency response, and evacuation plans would be updated to incorporate OTC modernization and its potential effects on the surrounding community. Therefore, Alternative 4 would result in less than significant impacts to public streets, potential public evacuation routes, and community emergency response plans.

Mitigation Measures and Residual Impacts

No impacts would occur for this criterion, so no mitigation measures are required. Therefore, there are no residual impacts.

WF-b: Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?

Construction and Operations

No impact. As described in Section 3.8.3 and shown on Figure 3.8-1 of the EIS, OTC is not located in a “high” or “very high” Fire Hazard Safety Zone. Although a significant portion of San Diego County is designated as a “high” or “very high” Fire Hazard Safety Zone, OTC is located in a highly urbanized area. Construction and operations under Alternative 4 would not exacerbate wildfire risks nor expose project occupants to wildfire pollution concentrations greater than any other part of the surrounding urbanized area. Therefore, Alternative 4 would result in no impacts to wildfire risks or project occupants.

Mitigation Measures and Residual Impacts

No impacts would occur for this criterion, so no mitigation measures are required. Therefore, there are no residual impacts.

WF-c: Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?

Construction and Operations

Less than significant impact. The OTC property is located in a highly urbanized area and would not require the installation of roads, fuel breaks, emergency water sources, or new power lines. Under Alternative 4, there would be a greater demand on existing utilities (electricity, natural gas, water, and sewer). The additional demand for utilities would be addressed in the planning, design, permitting, and ultimately the construction phases of project development. Therefore, Alternative 4 would result in less than significant impacts to infrastructure.

Mitigation Measures and Residual Impacts

Significant impacts would not occur for this criterion, so no mitigation measures are required. Therefore, there are no residual impacts.

WF-d: Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?

No Impact. The OTC property is located in a highly urbanized area that is not susceptible to flooding, landslides, runoff, or drainage hazards. Additionally, the Proposed Action area is not located within a "high" or "very high" Fire Hazard Safety Zone. Therefore, Alternative 4 would not impact the exposure of people or structures to significant risk from downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes.

Mitigation Measures and Residual Impacts

No impacts would occur for this criterion, so no mitigation measures are required. Therefore, residual impacts are the same as the impacts described above.

2.8.1.4 Alternative 5 Impacts

Construction and Operations

Impacts determinations for wildfire hazards under Alternative 5 would be identical to those under Alternative 4 (Section 2.8.1.3). Therefore, Alternative 5 would have no impacts or less than significant impacts for each of the significance criteria for wildfire.

Mitigation Measures and Residual Impacts

Impact avoidance and minimization measures (design features) in the EIS would lessen any potential impacts to wildfire hazards to less than significant levels. Significant impacts would not occur for this criterion, so no mitigation measures are required. Therefore, there are no residual impacts.

2.8.2 Cumulative Impacts

2.8.2.1 Wildfire (Public Health and Safety)

Description of Geographic Study Area

The ROI for public health and safety is generally defined as the existing OTC installation boundaries. However, off-installation areas may also become part of the ROI in instances where there is a potential for off-installation areas to affect, or be affected by, the Proposed Action. An example of off-installation influence would be if the Proposed Action directly elevated the wildfire hazard beyond OTC boundaries, or if the Proposed Action put OTC users and occupants in elevated danger from an off-site wildland fire as a result of project implementation.

Although a significant portion of San Diego County is designated as a "high" or "very high" Fire Hazard Safety Zone, OTC is located in a highly urbanized area. As described in Section 3.8.3 and shown on Figure 3.8-1 of the EIS, OTC is not located in a "high" or "very high" Fire Hazard Safety Zone.

Alternatives 4 and 5 include the consolidation of the Old Town Transit Center on OTC. The consolidation of transit services from the Old Town Station to OTC would have no impact on the existing wildland fire hazard.

Relevant Past, Present, and Future Actions

Table 4.3-2 in the EIS identifies those past, present, and reasonably foreseeable future projects that have the most potential to contribute to cumulative public health and safety effects when combined with the Proposed Action Alternatives. These projects include those that have the potential to be affected by, or affect, emergency services, air quality, aircraft safety compatibility, geologic hazards, electromagnetic radiation, hazardous materials and wastes, noise, security and force protection, and protection of children. Due to the urban setting of the Proposed Action, a direct threat from wildfire risk is not considered in this section.

Alternatives 4 and 5

Potential impacts from the public-private portions of OTC and the transit center under Alternatives 4 and 5 would come from the introduction of more people within and adjacent to the OTC boundaries (utilizing residential, office, dining, retail space, and the transit center). This includes having higher public use, including by children and elderly, than before. Consistent with the Midway-Pacific Highway Community Plan, Alternatives 4 and 5 would improve community access to public transportation and improve pedestrian safety and circulation through and around the OTC area during the day and night. Potential impacts to or from wildfire hazards would be less than significant since OTC is located within a highly urbanized environment.

Due to their proximity to OTC, Projects 15 (Pacific Highway Cycle Tracks), 21 (Barnett Bridge Rehabilitation), 24 (ITC), and 25 (APM) are the most likely cumulative projects to affect or be affected by OTC redevelopment. Those projects, like the Proposed Action, would not contribute substantially to wildfire hazards and therefore would not increase the hazard from wildfire at or to OTC.

Alternatives 4 and 5 and the cumulative projects would be consistent with the Midway-Pacific Highway Community Plan, which serves as a framework for ensuring that future development in the ROI prioritizes the health and safety of the public. Therefore, when added to the impacts from the identified cumulative projects, there would be no significant cumulative impacts to the wildfire aspect of public health and safety from implementation of Alternatives 4 and 5.

2.9 Public Services

Public services are a key part of any relationship between citizens and their governments. They represent the primary benefits that populations receive from payment of taxes. A description of regulatory setting, environmental setting, and assessment methodology are presented in Sections 3.10.1, 3.10.2, and 3.10.3 of the EIS, respectively. Government revenue generated by the Proposed Action Alternatives would be sufficient to fund the additional public services that would be required to maintain recent ratios. If property leaves federal ownership, property owners would pay local taxes on the value of their property and would be subject to local fees and assessments to the same extent as similarly situated entities and developments within the City of San Diego. If instead development were to occur on federally owned property under a lease scenario, the developer’s possessory interest in Federal land and improvements thereto would likely be taxable in accordance with the Constitution of the State of California and laws enacted thereunder. Other local fees and assessments would only apply in this latter scenario to the extent the Navy were to enter into an agreement with the City granting the City this authority over the private development on Federal land.

2.9.1 Impacts Determination

2.9.1.1 Impacts Summary

Table 2.9-1 presents a summary of impacts related to public services for each criterion specified in CEQA Appendix G Environmental Checklist Form. Explanation of each impact conclusion is provided in the following subsections.

Table 2.9-1 Impacts Related to Public Services

Criteria	*Potentially Significant*	*Less than Significant with Mitigation*	*Less than Significant*	*No Impact*
XV. PUBLIC SERVICES (PS-) Would the project:	-	-	-	-
a) Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for any of the public services:	-	-	-	-
i. Fire protection?	-	-	X	-
ii. Police protection?	-	-	X	-
iii. Schools?	-	-	X	-
iv. Parks?	-	-	X	-
v. Other public facilities?	-	-	-	X

Legend: - = no data in cell; X = selection for Alternatives 4 and 5.

2.9.1.2 No Action / No Project Alternative Impacts

The impacts of No Action Alternative for public services are described in Section 3.10.3.1, *Public Services*, of the EIS. The No Action Alternative would not generate additional population nor result in a need for additional public services facilities and would therefore result in no impacts to public services.

2.9.1.3 Alternative 4 Impacts

PS-a: Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for any of the public services:

i. Fire Protection

Construction

Less than significant impact. The construction industry of San Diego County, and surrounding areas (numbering 92,000 workers), is sufficient to supply the necessary workforce to complete construction projects without additional population relocating to the county; therefore, no permanent population increase that would require additional fire protection facilities is anticipated in association with construction for Alternative 4. There would be additional demands on fire services, related to activity at construction sites, however the additional demands would not be extensive enough to require additional fire facilities would be required to meet those demands.

Operations

Less than significant impact. Under Alternative 4 it is anticipated that an additional nine Fire/emergency medical personnel would be required to maintain current levels of service. This requirement would grow over time with three required as of 2035 and five as of 2040. The population growth fits into current planning parameters and would not in and of itself require the construction of a new fire station. Government revenue generated by the Proposed Action Alternatives would be sufficient to fund the additional public services that would be required to maintain recent ratios. The project would comply with all applicable fire codes and, prior to construction, the project applicant would consult with fire officials in order to ensure that response times to the area are not substantially affected.

Mitigation Measures and Residual Impacts

Impact avoidance and minimization measures (design features) in the EIS would lessen any potential impacts to response times to less than significant levels. Significant impacts would not occur for this criterion, so no mitigation measures are required. Therefore, there are no residual impacts.

ii. Police Protection

Construction

Less than significant impact. The construction industry of San Diego County, and surrounding areas, (numbering 92,000 workers), is sufficient to supply the necessary workforce to complete construction projects without additional population relocating to the county; therefore, no permanent population increase that would require additional police protection facilities is anticipated in association with construction for Alternative 4.

Operations

Less than significant impact. Under Alternative 4 it is anticipated that an additional 11 uniformed police officers would be required to maintain current levels of service. This requirement would grow over time with four required as of 2035 and six required as of 2040. The population growth fits into current planning parameters and would not, in and of itself require the construction of a new police station. Government revenue generated by the Proposed Action Alternatives would be sufficient to fund the additional public services that would be required to maintain recent ratios. The project would comply with all applicable fire codes and, prior to construction the project applicant would consult with police officials in order to ensure that response times to the area are not substantially affected.

Mitigation Measures and Residual Impacts

Impact avoidance and minimization measures (design features) in the EIS would lessen any potential impacts to response times to less than significant levels. Significant impacts would not occur for this criterion, so no mitigation measures are required. Therefore, there are no residual impacts.

iii. Schools

Construction

Less than significant impact. The construction industry of San Diego County, and surrounding areas, (numbering 92,000 workers), is sufficient to supply the necessary workforce to complete construction projects without additional population relocating to the county; therefore, no permanent population increase that would require additional schools is anticipated in association with construction for Alternative 4.

Operations

Less than significant impact. Under Alternative 4 it is anticipated that an additional 37 teachers would be required to maintain current levels of service. This requirement would grow over time with 12 required as of 2035 and 21 required as of 2040. Government revenue generated by the Proposed Action Alternatives would be sufficient to fund the additional public services that would be required to maintain recent ratios. As indicated in Section 3.5, *Socioeconomics*, the project would not lead to a condition of overcapacity in schools and therefore would not require the construction of a new school.

Mitigation Measures and Residual Impacts

Significant impacts would not occur for this criterion, so no mitigation measures are required. Therefore, there are no residual impacts.

iv. Parks

Construction

Less than significant impact. The construction industry of San Diego County, and surrounding areas, (numbering 92,000 workers), is sufficient to supply the necessary workforce to complete construction projects without additional population relocating to the county. In addition, OTC does not include city or county parks. Therefore, no permanent population increase that would require additional parks is anticipated in association with construction for Alternative 4.

Operations

Less than significant impact. The additional residents would increase the population-based park requirements for the community by approximately 40.2 acres for Alternative 4. A portion of parkland would be provided at OTC within the project footprint and would not have an adverse physical effect on the environment. The portion of parkland to be provided outside the OTC project footprint is currently unknown. Any new parkland developed would undergo the appropriate level of NEPA and/or CEQA analysis. In addition, the developers would work with the City of San Diego during the development process to meet the parks requirement. Therefore, it is assumed that additional recreational facilities developed outside the OTC project footprint as a result of the city's parkland planning factor would not have an adverse physical effect on the environment.

Mitigation Measures and Residual Impacts

Significant impacts would not occur for this criterion, so no mitigation measures are required. Therefore, there are no residual impacts.

v. Other Public Facilities

Construction

It is not anticipated that construction for Alternative 4 would require new, or physically alter, other public facilities in order to maintain acceptable service ratios or other performance objectives. Therefore, no impacts would occur.

Operations

It is not anticipated that operations for Alternative 4 would require new, or physically alter, other public facilities in order to maintain acceptable service ratios or other performance objectives. Therefore, no impacts would occur.

Mitigation Measures and Residual Impacts

Significant impacts would not occur for this criterion, so no mitigation measures are required. Therefore, there are no residual impacts.

2.9.1.4 Alternative 5 Impacts

Construction and Operations

Impacts determinations for public services Alternative 5 would be similar, but slightly less due to the lower density of development than those described under Alternative 4 (Section 2.9.1.3). Therefore, Alternative 5 would have less than significant impacts for each of the significance criteria for public services.

Mitigation Measures and Residual Impacts

Significant impacts would not occur for this criterion, so no mitigation measures are required. Therefore, residual impacts are the same as the impacts described above.

2.9.2 Cumulative Impacts

2.9.2.1 Description of Geographic Study Area

The ROI for public services includes potentially affected public service providers in San Diego County with a focus on those specific locations (such as schools or police stations) near the project area (refer to Figure 3.10-1 in the EIS).

2.9.2.2 Relevant Past, Present, and Future Actions

Table 4.3-2 in the EIS identifies those past, present, and reasonably foreseeable future projects that have the most potential to contribute to cumulative public service effects when combined with the Proposed Action Alternatives. The projects would result in an increase in demand for public services.

The Navy Broadway Complex/Manchester Gateway Development Project, the Hacienda Heights Apartments, and the University of California San Diego Long Range Development Plan for the Hillcrest Campus would be expected to increase permanent population in the ROI and therefore would generate additional demands on public services. The additional population would likely require additional personnel at public service agencies to maintain current levels of service. These projects would also generate government revenue that could be used to fund the additional demands. Also, legal requirements on developers to provide financial support for public services would support maintenance of levels of service.

Land use plans, such as the San Diego General Plan and the Midway-Pacific Highway Community Plan, do not in and of themselves spur population growth, but rather provide a framework to help ensure that additional population would not have adverse impacts to social and physical infrastructure. As described in the Midway-Pacific Highway Community Plan, parks, public spaces, and schools are vital to support a growing population (City of San Diego, 2019d).

2.9.2.3 Alternatives 4 and 5

Implementation of Alternative 4 and Alternative 5 would necessitate the development of additional parkland. The alternatives would not in and of themselves necessitate the construction of additional schools, police or fire stations, or other public services, but would contribute to the future need for additional facilities for those public services. Any additional facilities required due to population growth associated with Alternatives 4 and 5 combined with cumulative projects must meet planning and permitting requirements and pay applicable impact fees as required. Because the additional facilities would meet requirements and pay applicable fees, it is not likely that construction of the additional facilities would cause significant environmental impacts. Therefore, there would not be a significant cumulative impact associated with Alternatives 4 or 5.

2.10 Utilities/Service Systems and Energy (Infrastructure)

This section describes the potential environmental impacts to utilities/service systems and energy (including potable water supply, sewer and wastewater, solid waste management, stormwater runoff infrastructure, electricity, natural gas, and telecommunications) from the implementation of the Alternatives 4 and 5. A description of regulatory setting, environmental setting, and assessment methodology are presented in Sections 3.11.1, 3.11.2, and 3.11.3 of the EIS, respectively.

2.10.1 Impacts Determination

2.10.1.1 Impacts Summary

Table 2.10-1 presents a summary of impacts related to utilities/service systems and energy for each criterion specified in CEQA Appendix G Environmental Checklist Form. Explanation of each impact conclusion is provided in the following subsections.

Table 2.10-1 Impacts Related to Utilities/Service Systems and Energy

Criteria	*Potentially Significant*	*Less than Significant with Mitigation*	*Less than Significant*	*No Impact*
VI. ENERGY (EN-) Would the project:	-	-	-	-
a) Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?	-	-	**X**	-
b) Conflict with or obstruct a state or local plan for renewable energy or energy efficiency?	-	-	**X**	-
XIX. UTILITIES AND SERVICE SYSTEMS (UTIL-) Would the project:	-	-	-	-
a) Require or result in the relocation or construction of new or expanded water, wastewater treatment or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?	-	-	**X**	-
b) Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years?	-	-	**X**	-

	Criteria	Potentially Significant	Less than Significant with Mitigation	Less than Significant	No Impact
c)	Result in a determination by the wastewater treatment provider, which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?	-	-	X	-
d)	Generate solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?	-	-	X	-
e)	Comply with federal, state, and local management and reduction statutes and regulations related to solid waste?	-	-	X	-

Legend: - = no data in cell; X = selection for Alternatives 4 and 5.

2.10.1.2 No Action/No Project Alternative Impacts

The impacts of the No Action Alternative for utilities, service systems, and energy are described in Section 3.11.3.1 of the EIS, *Infrastructure*. No increases in energy use would occur under the No Action Alternative, and the OTC would continue to comply with state and local plans. The No Action Alternative would have no impacts on utilities, service systems, and energy.

2.10.1.3 Alternative 4 Impacts

UTIL-a: Require or result in the relocation or construction of new or expanded water, wastewater treatment or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?

Construction

Less than Significant Impacts. Construction would result in reconfiguration of on-site infrastructure for the conveyance of public utilities, due to the expanded foundation and footprint of the Proposed Action. However, off-site public infrastructure would not need to be relocated or expanded. Figure 3.11-5 of the EIS shows a block-by-block representation of on-site utilities distribution for water, sewer and stormwater, sufficient for Alternative 4. The figure represents a conceptual design. Final design would determine the exact placement for each utility. The relocation and/or replacement of existing infrastructure would be in conformance with Navy's established or adopted building standards and Uniform Building Codes. Reconnection to utilities would take place during off-peak hours to avoid interruption of service.

Operations

Less than Significant Impacts. Since existing public water delivery infrastructure in the project area are currently operating within their service capacity, modifications or development of new water infrastructure would not be necessary to service Alternative 4. Water easements may need to be relocated within the Alternative 4 footprint. Alternative 4 would neither require the modification or development of new public infrastructure, nor result in the use of a substantial portion of remaining capacity. Therefore, Alternative 4 would result in less than significant impacts to water utilities.

The City of San Diego Sewer Design Guide identifies criteria for the design of sewer systems and requires preparation of a sewer planning study for new sewer facilities that demonstrates that there are no negative impacts on the existing sewer system. The modified system would take place on-site and be designed to provide adequate capacity to handle the expected wastewater associated with the proposed project and maintain flow conditions to ensure plumbing construction in compliance with City of San Diego Sewer Design Guide and California Plumbing Code. The implementation of new and modified sewer facilities constructed in compliance with the city's Sewer Design Guide would ensure that adequate conveyance of the projected increase in wastewater flow would be provided for Alternative 4.

The density of uses proposed by Alternative 4 would increase the amount of wastewater conveyed through existing sewer facilities. However, Alternative 4 would not result in the construction of new local infrastructure that could cause significant environmental impacts not already addressed as part of the proposed project. Alternative 4 would not exceed the capacity of conveyance or treatment of wastewater for the project site. Impacts to wastewater and sewer systems would remain less than significant.

The estimated increase in electricity demand for Alternative 4 is related to the private development which would add 68,306 megawatts per hour. Alternative 4 would require an additional 71,406 megawatts per hour, compared to the No Action Alternative. Due to the increased efficiency of modern construction, fixtures, and appliances, in general the intensity of use per square feet of space would be expected to decrease under Alternative 4, compared to current operations. Additional electricity demand for Alternative 4 would represent approximately 1.8 percent of current demand within the San Diego Gas and Electric (SDG&E) planning area. SDG&E performs modeling for electrical power demand on a continual basis to manage resource portfolios and infrastructure needs. New power loads are considered together with other foreseeable loads in the project vicinity and any upgrades to distribution networks or substations would be identified. The current 69-kilovolt circuits running along north western edge of OTC, terminating at the "NTCQ" substation would serve the project loads. There would be no need to upgrade the electrical distribution infrastructure as a result of the project.

Alternative 4 could potentially increase natural gas consumption by 134,911 thousand cubic feet compared to the No Action Alternative. According to the current and projected estimates reported in the 2018 California Gas Report, this represents approximately 0.3 percent of gas demand for the SDG&E planning area. This level of increased demand could be supplied by the current public infrastructure including the 16-inch steel pipeline under Pacific Highway.

Although Alternative 4 would result in increases in consumption of energy, it is not outside of the planned demand increases described in the California Demand Forecast for 2018-2030, or the California Gas Report 2016. While energy use at the site would increase, energy intensity of use is expected to decrease due to sustainable design standards and energy saving efficiencies that would be part of final design pursuant to Navy's instruction. The energy supplier for the project, SDG&E, delivered 45 percent renewable energy to its customers last year, well in excess of the current Renewables Portfolio Standard of California. SDG&E is expected to continue to expand its renewables portfolio in line with state goals. Along with sustainable design standards and energy saving efficiencies that would be part of final design pursuant to Navy's instruction, this energy use increase is expected to comply with federal orders and guidelines.

Therefore, Alternative 4 would result in less than significant impacts to capacities and infrastructure of electrical and gas utilities.

Mitigation Measures and Impacts after Mitigation

Significant impacts would not occur for this criterion, so no mitigation measures are required. Therefore, impacts would be less than significant.

UTIL-b: Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years?

Construction

Less than Significant Impacts. Existing water utilities would need to be sourced through public infrastructure during construction If existing water supplies are sourced for the operational activities that would remain on the project site during construction, use levels would remain below current operational levels. Current levels of water service to the project site are sufficient to support remaining operational activities during construction of Alternative 4. Water delivery services would be necessary to supply water for construction activities. Temporary potable water sources would be provided by a private contractor for construction workers during demolition and construction activities. Public utilities would not be accessed for construction use. Water demand from public utilities would not be increased during construction.

Operations

Less than Significant Impacts. Alternative 4 is estimated to consume 2,182,793 gallons per day of water. Estimated water use by the Navy under Alternative 4 is estimated to decrease by 18,755 gallons per day to approximately 141,080 gallons per day, while the proposed private development would account for 2,041,713 gallons per day of added water consumption. The high water demand from the proposed private development is mainly due to the addition of 10,000 residential units, which would account for 1,766,772 gallons per day of this increase. Due to the number of residential units and the overall increase in potable water demand, California Water Code Sections 10910-10915 would require the San Diego Public Utilities Department to determine whether the water demands of the proposed project were accounted for in the Urban Water Management Plan and complete a Water Supply Assessment for the project.

The current water supply in the San Diego County Urban Water Management Plan is reported as 200,984-acre feet per year for 2020, increasing to 273,408 by 2040 and beyond (San Diego County Water Authority, 2016). The total project demand for Alternative 4 would account for 1.2 percent of current supply and 0.9 percent of future water supply. The peak hourly rate could account for 3.8 percent of system delivery capacity from the Alvarado Treatment Plant. Although it appears that there is sufficient water supply capacity to serve Alternative 4, a Water Supply Assessment would be required by the City of San Diego Public Utilities Department to determine the extent to which the project would increase water demand and how to convey available water supplies from existing entitlements and resources. Ultimately, the city would need to determine that adequate supply exists to serve Alternative 4 without affecting San Diego Public Utilities Department's ability to fulfill its existing and future obligations under normal dry and multiple dry year conditions. These studies would also synchronize project phasing and project proponents would coordinate with San Diego Public Utilities Water Department to refine the timing of the expected demand.

Therefore, the analysis has not determined that any significant impacts would occur as a result of Alternative 4.

Mitigation Measures and Impacts after Mitigation

Significant impacts have not been determined for this criterion, so no mitigation measures are required. Therefore, residual impacts are the same as the impacts described above.

UTIL-c: Result in a determination by the wastewater treatment provider, which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?

Construction

Less than Significant Impacts. Existing wastewater utilities would need to be sourced through public infrastructure during construction. If existing wastewater utilities are sourced for the operational activities that would remain on the project site during construction, wastewater generation would remain below current operational levels. Existing sewer utilities connecting to the project site are sufficient to support operational activities during construction of Alternative 4. Temporary wastewater services would be necessary during construction. Temporary portable toilets could be provided by private contractor for construction workers during demolition and construction activities. There would be no increased demand on wastewater and sewer infrastructure during construction.

Operations

Less than Significant Impacts. The Point Loma Wastewater Treatment Plant is operating at approximately 73 percent of full capacity. It has capacity to treat 240 million gallons per day of wastewater and currently treats approximately 175 million gallons of wastewater per day (San Diego Public Utilities Department, 2014). Existing wastewater infrastructure in the OTC area is currently operating within service capacity, and there are no identified infrastructure deficiencies (San Diego Public Utilities Department, 2014).

The sewage flow to Point Loma Water Treatment Plant would increase by up to 1.4 million gallons per day, or approximately 0.6 percent of system capacity. The City of San Diego wastewater hydraulic capacity was modeled to handle the urban flows typical in the Downtown area. The potential increase in wastewater that would be generated by Alternative 4 would not significantly affect the quality of water discharged from the outfall and would not affect the ability of the city to provide secondary treatment of the wastewater. It would also not significantly affect the capacity of the wastewater treatment system. Alternative 4 would not exceed the capacity of conveyance or treatment of wastewater for the project site, therefore a less than significant impact would occur.

Mitigation Measures and Impacts after Mitigation

Significant impacts would not occur for this criterion, so no mitigation measures are required. Therefore, less than significant impacts would occur.

UTIL-d: Generate solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?

Construction

Less than Significant Impacts. Construction and demolition would result in generation of increased levels of solid wastes. Alternative 4 would generate an estimated 27,786 tons of total construction and demolition debris, of which 9,725 tons will be delivered to the Miramar Landfill. The rest will be diverted to recycling and reuse according to waste reduction standards of San Diego County. Specific loads of construction and demolition wastes are combined with operational wastes below to consider the maximum impact in a single year for determination of impacts to municipal solid waste disposal utilities.

Operations

Less than Significant Impacts. As stated above, the total construction and demolition debris are combined with solid waste that would be generated during the first year of operations, to assess worst case scenario. An additional 33,443 tons of solid waste would be generated annually due to operations, of which 16,722 tons would be directed toward Miramar Landfill. When solid waste from operational activities is combined with the construction and demolition debris (9,725 tons), a total of 26,447 tons of solid waste would be delivered to the Miramar Landfill under Alternative 4. The rest will be diverted to recycling and reuse according to waste reduction standards mandated by the state and set forth in San Diego County's Strategic Plan to Reduce Waste.

According to San Diego Public Works Department, the Miramar Landfill accepts 910,000 tons of solid waste annually. Therefore, the maximum combined quantity of municipal solid waste generated as a result of Alternative 4 would represent about 2.91 percent of average annual solid waste accepted by the Miramar Landfill if all construction waste were combined with 1 year of annual waste generated by operation activities. However, construction and demolition are likely to take place over several years, so the actual amounts delivered to landfills each year are expected to be lower. Additionally, after construction has been completed, the average annual contribution of solid waste to Miramar Landfill would only represent about 1.8 percent of total solid waste delivered annually to the Miramar Landfill. Solid waste that would be generated during operations of Alternative 4 would only represent 0.6 percent of permitted throughput capacity. Therefore, Alternative 4 would result in less than significant impacts on the municipal solid waste facilities serving the project site.

Mitigation Measures and Impacts after Mitigation

Significant impacts would not occur for this criterion, so no mitigation measures are required. Therefore, residual impacts are the same as the impacts described above.

UTIL-e: Comply with federal, state, and local management and reduction statutes and regulations related to solid waste?

Construction

Less than Significant Impacts. According to the DoD Strategic Sustainability Performance Plan, a significant portion (60 percent) of construction and demolition wastes would be diverted. San Diego County's Strategic Plan to Reduce Waste, includes California state goals of 75 percent waste diversion for recycling and reuse. The amount of solid waste diverted under Alternative 4 would be consistent with federal, state, and local management and reduction statutes and regulations. Therefore, impacts related to Alternative 4 would be less than significant.

Operations

Less than Significant Impacts. Per AB 939, San Diego Municipal Code Chapter 6, and San Diego County Public Works guidelines require that 50 percent of solid waste be diverted for recycling or reuse. The project will divert at least more than 50 percent of solid waste from landfills. Alternative 4 would comply with waste management and reduction statutes and regulations. Therefore, impacts related to Alternative 4 would be less than significant.

Mitigation Measures and Impacts after Mitigation

Significant impacts would not occur for this criterion, so no mitigation measures are required. Therefore, residual impacts are the same as the impacts described above.

EN-a: Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?

Construction

Less than Significant Impacts. Existing electricity and natural gas utilities may need to be sourced during construction. If existing electrical or natural gas utilities are sourced during construction, use levels would remain below current operational levels based on a decreased footprint and need for electrical supply. Current levels of electrical and natural gas service to the project site are sufficient to support any remaining operational activities that would occur on the project site during construction of Alternative 4. In general, demand for electricity sourced through public infrastructure would decrease during construction. Current infrastructure would be used to convey resources to the portions of the OTC where operations are continuing during construction. Energy for construction would mainly be in the form of fuels to power equipment. This would not contribute to wasteful or inefficient use of energy since it would be similar to what is currently employed to convey energy to and from the site.

Operations

Less than Significant Impacts. The estimated increase in electricity demand for Alternative 4 is associated with the proposed private development, which consume an additional 68,306-megawatt hours over the No Action Alternative. Alternative 4 would require an additional 71,406-megawatt hours of electricity, compared to the No Action Alternative.

According to the California Energy Demand Updated Forecast for 2018-2030, total demand for the SDG&E planning area is 4,024 gigawatts per hour. Additional electricity demand for Alternative 4 would represent approximately 1.8 percent of current demand within the SDG&E planning area. SDG&E performs modeling for electrical power demand on a continual basis to manage resource portfolios and infrastructure needs. New power loads are considered together with other foreseeable loads in the project vicinity and any upgrades to distribution networks or substations would be identified. The current 69-kilovolt circuits running along the northwestern edge of project site terminates at the “NTCQ” substation, which would serve the project loads. There would be no need to upgrade the electrical distribution infrastructure as a result of Alternative 4.

Alternative 4 could potentially increase natural gas consumption by 134,911 thousand cubic feet compared to the No Action Alternative. Based on the current and projected estimates reported in the 2018 California Gas Report, natural gas consumption from Alternative 4 represents approximately 0.3 percent of gas demand for the SDG&E planning area.

Although Alternative 4 would increase energy consumption, the projected energy demand is within the planned demand increases described in the California Demand Forecast for 2018-2030, or the California Gas Report 2016. While overall energy use at the project site would increase, energy efficiency would also increase due to sustainable design standards and energy saving features that will be part of the final design pursuant to Navy’s instruction. Therefore, impacts to electrical and gas utilities would be less than significant.

Mitigation Measures and Impacts after Mitigation

Significant impacts would not occur for this criterion, so no mitigation measures are required. Therefore, less than significant impacts are expected.

EN-b: Conflict with or obstruct a state or local plan for renewable energy or energy efficiency?

Construction

Less than Significant Impacts. There would be no increased use of public utilities and infrastructure related to electricity or natural gas during construction. The majority of energy used on site would be related to construction equipment and the majority of this power demand would be met through portable generators in the field and connections to existing utilities would be limited.

Operations

Less than Significant Impacts. While overall energy use at the project site would increase with implementation of Alternative 4, energy intensity of use is expected to decrease due to sustainable design standards and energy saving efficiencies that will be part of final design pursuant to Navy's instruction. The energy supplier for the project, SDG&E, delivered 45 percent renewable energy to its customers last year, well in excess of the current Renewables Portfolio Standard of California which currently mandates that 30 percent electricity consumption is derived from renewable energy. SDG&E is expected to continue to expand its renewables portfolio in line with state goals to achieve the milestones set forth in SB 100. Along with sustainable design standards and energy saving efficiencies that will be part of final design pursuant to Navy's instruction, the potential increase in energy use is expected to comply with state and local plans and guidelines for renewable energy or energy efficiency. Alternative 4 would result in a less than significant impact to local and state plans for renewable energy and energy efficiency.

Mitigation Measures and Impacts after Mitigation

Significant impacts would not occur for this criterion, so no mitigation measures are required. Therefore, less than significant impacts are expected.

2.10.1.4 Alternative 5 Impacts

Construction

Impacts determinations for utilities and infrastructure under Alternative 5 would be identical to those under Alternative 4 (Section 2.10.1.3). Therefore, Alternative 5 would have less than significant impacts for each of the significance criteria for infrastructure.

Operations

Impact avoidance and minimization measures (design features) would lessen any potential impacts to infrastructure and public utilities to less than significant levels. Significant impacts would not occur for Alternative 5, so no mitigation measures are required. Therefore, less than significant impacts are expected for Alternative 5.

2.10.2 Cumulative Impact Analysis

2.10.2.1 Utilities/Service Systems and Energy (Infrastructure)

Description of Geographic Study Area

The ROI for infrastructure and public utilities includes potentially affected public utilities systems and providers in San Diego County with a focus on the capacities and conveyance infrastructure (such as water supply, sewer treatment, electricity supply and generation mix, natural gas supply, and landfills) in the service area that envelopes the project area and adjacent areas.

Relevant Past, Present, and Future Actions

Table 4.3-2 of the EIS identifies past, present, and reasonably foreseeable future projects that have the most potential to contribute to cumulative infrastructure effects when combined with the Proposed Action Alternatives. The cumulative projects would result in an increase in utility demand. For example, the Navy Broadway Complex/Manchester Gateway Development Project, The Post, Sports Arena Development, and the Hacienda Heights Apartments cumulative projects are expected to incrementally increase demand for most utility infrastructure and utility systems within the ROI, such as: water, wastewater and sewer, solid waste, electricity, and natural gas. In addition, the identified community and regional plans/programs provide a framework and recommended measures and guidelines to help ensure that future development would have sufficient infrastructure supply to support development demands.

Alternatives 4 and 5

Alternative 4 and to a lesser extent, Alternative 5, would lead to a permanent increase in demand on public utilities within the ROI. Implementation of the alternatives would also result in more energy-efficient structures at OTC. Overall, the identified cumulative projects would increase the demand for water, sewer, electrical, and natural gas use within the ROI. While these projects would result in an increase in demand on utility demand and utility infrastructure, they are most likely to generate utility revenue that could be used to fund any necessary infrastructure upgrades and support maintenance of service to fulfill existing and projected utility obligations.

Some of the proposed cumulative projects would replace existing, energy-poor structures, resulting in more energy-efficient structures. Regional goals of increasing renewable energy sources would retain energy supply but reduce associated carbon emissions. The increased use of clean and renewable sources of energy is also a CAP strategy that can be employed within the ROI. The continuation of water conservation techniques and designs would help minimize increases in water demand.

Energy efficiency, water conservation, and waste reduction are major elements of the Midway-Pacific Highway Community Plan. Section 4.8 of the Community Plan identifies several sustainable design concepts to increase energy and water efficiency, increase on-site energy generation, and reduce waste generation (City of San Diego, 2019d). Thus, overall, implementation of Alternatives 4 and 5 would occur in an area with cumulative projects, plans, and programs committed to planning for the smart and efficient use of infrastructure within the ROI. Therefore, implementation of Alternatives 4 and 5 when combined with the past, present, and reasonably foreseeable future projects would not result in significant cumulative impacts to infrastructure within the ROI.

2.11 Noise

Sound is a physical phenomenon consisting of minute vibrations that travel through a medium, such as air or water, and are sensed by the human ear. The perception and evaluation of sound involves three basic physical characteristics:

- Intensity – the acoustic energy, which is expressed in terms of sound pressure, in dB
- Frequency – the number of cycles per second the air vibrates, in Hertz
- Duration – the length of time the sound can be detected

Noise is defined as unwanted or annoying sound that interferes with or disrupts normal human activities. Although continuous and extended exposure to high noise levels (e.g., through occupational exposure) can cause hearing loss, the principal human response to noise is annoyance (see EIS Appendix M). A description of regulatory setting, environmental setting, and assessment methodology are presented in Section 3.13 of the EIS.

2.11.1 Impacts Determination

2.11.1.1 Impacts Summary

Table 2.11-1 presents a summary of impacts related to noise for each criterion specified in CEQA Appendix G Environmental Checklist Form. Explanation of each impact conclusion is provided in the following subsections.

Table 2.11-1 Impacts Related to Noise

Criteria	*Potentially Significant*	*Less than Significant with Mitigation*	*Less than Significant*	*No Impact*
XIII. NOISE (NOI-) Would the project:				
a) Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	**X**	-	-	-
b) Generation of excessive groundborne vibration or groundborne noise levels?	-	-	**X**	-
c) For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within 2 miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?	-	-	**X**	-

Legend: - = no data in cell; X = selection for Alternatives 4 and 5.

2.11.1.2 No Action/No Project Alternative Impacts

The impacts of No Action Alternative for noise are described in Section 3.13.4.1 of the EIS, *Noise*. The No Action Alternative would result in less than significant noise impacts.

2.11.1.3 Alternative 4 Impacts

NOI-a: Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction

Potentially significant impact. As described in Section 3.13 of the EIS, the OTC is within the City of San Diego Midway-Pacific Highway Community Planning Area described as an urbanized community adjacent to Interstate 5 to the east and the Marine Corps Recruit Depot to the south. Existing noise in the vicinity of OTC includes vehicular traffic on Pacific Highway and Interstate 5 as well as aircraft operations at San Diego International Airport. The Health and Human Services Agency Hospital 200 feet west of the northwest corner of OTC Site 1 across Pacific Highway is the nearest noise sensitive receptor, followed by Dewey Elementary School and a residential neighborhood approximately 1,000 feet southwest of OTC Site 2.

Similar to other alternatives, Alternative 4 includes construction of new Navy facilities for NAVWAR on OTC through a public-private development and mixed-use residential, hotel, office, and/or retail development. In addition, Alternative 4 would develop a transit center on OTC as part of a revitalization effort. Potential impacts due to noise associated with construction, repair, renovation, and/or demolition would be periodic over the development stage. Construction activity would generate increased noise levels while equipment operates nearest noise sensitive receptors adjacent OTC that may not be able to be fully mitigated. Given the long 30-year timeframe allowed for construction nearby noise sensitive locations, such as the Veteran's Village, the Health and Human Services Hospital, and a healthcare facility would experience elevated noise levels during extended periods of construction under Alternative 4.

Operations

Less than significant impact. Ongoing operation of the newly constructed mixed-use residential, hotel, office, and/or retail development would not be a significant source of noise and would be consistent with the San Diego Midway-Pacific Highway Community Planning Area guidelines. However, the new development would double vehicular traffic on some streets, which would result in increased traffic noise contours of approximately 3 dB CNEL. This increase would be less than the Federal Highway Administration threshold of 5 to 15 dB defined as a substantial noise increase.

Mitigation Measures and Residual Impacts

Construction would follow all local ordinance and avoid quiet time hours and equipment would utilize appropriate noise suppression equipment, such as mufflers. Building design and layout would account for aircraft and traffic noise levels to achieve appropriate interior noise levels as described in the local community plan.

NOI-b: Generation of excessive ground borne vibration or ground borne noise levels?

Construction

Less than Significant Impacts. Although conventional construction activities may be perceptible, these activities would not be capable of exceeding structural damage thresholds outlined by the Caltrans Transportation and Construction Vibration Guidance (Caltrans, 2020). The City of San Diego Municipal Code prohibits construction between 7 p.m. and 7 a.m. on Mondays through Saturdays and all day on

Sundays and holidays. This minimizes the impact of construction activity and would limit the exposure of noise sensitive receptors to conventional construction during the most sensitive times. In addition, pile driving would not occur during construction. Therefore, construction under Alternative 4 would result in less than significant noise impacts due to excessive ground borne vibration or ground borne noise levels.

Operations

Less than Significant Impacts. The proposed land uses in OTC include residential, hotel, office, and/or retail developments which do not typically generate notable vibration. The proposed transit center would include buses, a light rail trolley, and the Amtrak and COASTER service. The existing Amtrak rails would reside in their current location along Interstate 5 while the station would be moved to within OTC, roughly a quarter mile south of the current Old Town Transit Center location. Noise from buses and light rail trolley would not substantially exceed existing noise levels due to similar noise-generating activities such as vehicular traffic along Pacific Highway and Interstate 5 and existing rail activities. Amtrak operations would not significantly exceed existing rail noise. Therefore, operations under Alternative 4 would result in less than significant noise impacts due to excessive ground borne vibration or ground borne noise levels.

Mitigation Measures and Residual Impacts

Less than significant impacts would occur for this criterion, so no mitigation measures are required. Therefore, there would be no residual impacts.

NOI-c: For a project located within an airport land use plan or, where such a plan has not been adopted, within 2 miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?

Construction

Less than Significant Impacts. Most construction activities related to implementation of Alternative 4 would potentially generate short-term noise levels in excess of ambient levels, as discussed under NOI-a. However, no additional excessive noise impacts would result due to construction occurring within 2 miles of San Diego International Airport and safety issues related to construction are discussed in the Public Health and Safety section.

Operations

Less than Significant Impacts. The Midway-Pacific Highway Community Planning Area experiences noise from existing San Diego International Airport ranging from 60 to greater than 65 dBA CNEL. The Airport Land Use Compatibility Plan conditionally allows future mixed-use and/or multi-unit residential uses in areas above the 65-dBA CNEL in locations where community plans have allowed residential. These future residential developments require building construction noise attenuation to reduce noise levels to below 45 dB CNEL on the interior. Typical new construction meeting current energy guidelines often exceeds the required noise level reduction to meet the Airport Land Use Compatibility Plan interior guidelines for noise sensitive uses; therefore, the risk in this instance may be relatively low. Therefore, operations under Alternative 4 would result in less than significant noise impacts due to excessive noise for people residing or working in the project area.

Mitigation Measures and Residual Impacts

Construction would follow all local ordinance and avoid quiet time hours and equipment would utilize appropriate noise suppression equipment, such as mufflers. Building design and layout would account for aircraft and traffic noise levels to achieve appropriate interior noise levels as described in the local community plan.

2.11.1.4 Alternative 5 Impacts

Construction and Operations

Impacts determinations for noise under Alternative 5 would be similar to those under Alternative 4 and would be potentially significant due to the long 30-year construction timeframe.

Mitigation Measures and Residual Impacts

Similar to Alternative 4, construction would follow all local ordinance and avoid quiet time hours and equipment would utilize appropriate noise suppression equipment, such as mufflers. Building design and layout would account for aircraft and traffic noise levels to achieve appropriate interior noise levels as described in the local community plan.

2.11.2 Cumulative Impacts

2.11.2.1 Description of Geographic Study Area

The ROI for noise comprises OTC footprint and areas with noise sensitive land uses in the vicinity of OTC, which includes residential areas, schools, places of worship, and hospitals. The nearest noise sensitive land uses within the ROI are:

- Veteran's Village transitional housing located adjacent OTC Site 1 to the east
- Health and Human Services Agency Hospital located adjacent to the northwest border of OTC Site 1
- Dewey Elementary School and a residential neighborhood located approximately 1,000 feet southwest of OTC Site 2
- several places of worship and a residential neighborhood located 300 feet to the northeast of OTC Site 1, beyond Interstate 5

Aircraft activity at San Diego International Airport and vehicular traffic along Interstate 5 and city streets represent the primary sources of noise within the ROI. Noise levels within the ROI typically are in the 60 and 65 dB CNEL range, as depicted in Figure 3.13-2.

2.11.2.2 Relevant Past, Present, and Future Actions

Table 4.3-2 of the EIS lists the reasonably foreseeable cumulative actions that might interact with Alternatives 4 and 5 and cumulatively affect noise within the ROI. These projects primarily consist of construction and development projects. Management plans such as the San Diego General Plan, the community plans, or regional plans have the potential to shift land use over time and impact the noise environment and sensitive noise receptors. Major projects, such as the expansion of the San Diego International Airport, could result in greater numbers of aircraft operating at San Diego International Airport and an associated increase in aircraft-generated noise within the ROI.

2.11.2.3 Cumulative Impact Analysis

The analysis in Section 3.13 of the EIS indicates that Alternatives 4, and 5 could cause significant noise impacts due construction noise during the extended development schedule. Cumulative noise impacts could generally arise from past, present, or reasonably foreseeable future projects creating noise sensitive land uses in the vicinity of OTC or generating noise that could impact noise sensitive uses at OTC (i.e., residential).

2.11.2.4 Alternatives 4 and 5

Collectively within the ROI, there would be a greater potential for temporary cumulative impacts to the noise environment due to the increase in cumulative projects considered, and the increase in scope of Alternatives 4 and 5.

Operationally, the APM would result in a new permanent noise source within the ROI, if located aboveground. The aboveground option would introduce rail noise on streets that do not currently have rail operations along that road or immediately adjacent. If below ground, most, if not all, of the noise would be indistinguishable within the noise environment. However, the noise generated would be similar to existing rail traffic noise within the ROI. Proposed regional transportation plans aim to reduce the vehicles and correspondingly could result in a decrease in vehicle-generated noise and an increase in the frequency of noise generated by mass transit modes (e.g., buses and trains). Aircraft activity at San Diego International Airport and traffic along Interstate 5 would continue to dominate the noise environment within the ROI (refer to Figure 3.13-2 in the EIS). Therefore, when combined with past, present, and reasonably foreseeable future projects, implementation of Alternatives 4 or 5 would not result additional impacts of significant cumulative impacts beyond the potentially significant excessive periodic construction noise associated with Alternatives 4 or 5.

2.12 Geology/Soils and Mineral Resources

Geology, soils, and mineral resources include surface and bedrock materials, orientation of rock units, and unique structures that may contain valuable resources such as mineral deposits, sand and gravel, petroleum reserves, or fossils. Mineral resources can be metallic or non-metallic earth materials and energy deposits that can be extracted for a useful purpose, such as iron ore that can be refined to make steel, gravel that can be used to build roads, geothermal resources, or petroleum and natural gas reserves. Soil refers to unconsolidated and weathered earthen materials overlaying bedrock or other parent material. Soil structure, elasticity, strength, shrink-swell potential, liquefaction potential, and erodibility can all determine the ability of the ground to support structures and facilities. A description of regulatory setting and environmental setting are presented in Sections 3.14.1 and 3.14.2 of the EIS, respectively.

2.12.1 Impacts Determination

2.12.1.1 Impacts Summary

Table 2.12-1 presents a summary of impacts related to geology/soils and mineral resources for each criterion specified in CEQA Appendix G Environmental Checklist Form. Explanation of each impact conclusion is provided in the following subsections.

Table 2.12-1 Impacts Related to Geology/Soils and Mineral Resources

Criteria	*Potentially Significant*	*Less than Significant with Mitigation*	*Less than Significant*	*No Impact*
VII. GEOLOGY AND SOILS (GEO-) Would the project:	-	-	-	-
a) Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:	-	-	-	-
i. Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map, issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.	-	-	**X**	-
ii. Strong seismic ground shaking?	-	-	**X**	-
iii. Seismic-related ground failure, including liquefaction?	-	-	**X**	-
iv. Landslides?	-	-	**X**	-
b) Result in substantial soil erosion or the loss of topsoil?	-	-	**X**	-
c) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?	-	-	**X**	-
d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?	-	-	**X**	-
e) Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater?	-	-	-	**X**
f) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	-	-	-	**X**
XII. MINERAL RESOURCES (MIN-) Would the project:	-	-	-	-
a) Result in the loss of availability of a known mineral resource that would be a value to the region and the residents of the state?	-	-	-	**X**
b) Result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?	-	-	-	**X**

Legend: - = no data in cell; X = selection for Alternatives 4 and 5.

2.12.1.2 No Action/No Project Alternative Impacts

The impacts of No Action Alternative for geology, soils, and mineral resources are described in Section 3.14.3.1 of the EIS, *Geological Resources*. The No Action Alternative would result in less than significant impacts to geology, soils, and mineral resources. However, operations at OTC would continue in the existing buildings without significant renovations and the buildings would not be updated with required facility seismic upgrades or replaced with buildings meeting modern seismic safety standards. Therefore, the No Action Alternative could result in significant impacts from geologic hazards.

2.12.1.3 Alternative 4 Impacts

GEO-a: Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:

- **i. Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map, issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.**
- **ii. Strong seismic ground shaking?**
- **iii. Seismic-related ground failure, including liquefaction?**
- **iv. Landslides?**

Construction

Less than significant impact. Under Alternative 4, new facilities would be constructed for NAVWAR on OTC. Construction would require earthwork and grading.

i. Rupture of a known earthquake fault. Faults directly adjacent to OTC are considered active or potentially active. In particular, the nearby Rose Canyon Fault Zone is known to be an active fault in the area of Old Town, less than a mile from the OTC project site (refer to Figure 3.14-1 in the EIS). In addition, the Spanish Bight Fault may connect with northern segments of the Rose Canyon Fault Zone along an alignment that could transect OTC. Because of the newly identified Alquist-Priolo Earthquake Fault Zone within the southeast portion of OTC Site 1 and the presence of nearby active and potentially active faults, a Faulting, Seismicity, and Geologic Hazards Investigation would need to be conducted to determine whether an active fault is located within OTC. If the investigation identifies an active fault within OTC, a Fault Surface Rupture Displacement Hazard Investigation and a Geotechnical, Geologic, and Seismic Hazards Impacts Investigation would also need to be conducted (SANDAG, 2020b). The purpose of the first investigation would be to estimate the fault rupture displacements, while the second investigation would describe the hazard mitigation design alternatives. A probabilistic fault hazard displacement assessment should also be performed to estimate the magnitude of displacement to be addressed in the design of features crossing the fault (SANDAG, 2020b).

If needed, measures identified in the geotechnical investigation would be implemented to minimize associated impacts from rupture of a known earthquake fault. These measures may include that any new construction under Alternative 4 would adhere to required setbacks from any active fault identified during the geotechnical investigation. The Alquist-Priolo Special Studies Zone Act states that no occupied structure shall be built on a trace of a fault that has a well-defined surface expression and is known to be sufficiently active in the Holocene (i.e., within the last 11,700 years). If potentially active faults are identified (with known movement in the Quaternary period, older than 11,700 years) during the geotechnical investigation, a project geologist would recommend setbacks for the planned locations of structures.

ii. Strong seismic ground shaking. Active and potentially active faults within the vicinity of OTC and the San Diego area could result in strong seismically-induced ground motion and associated ground shaking. As discussed above, a Geotechnical, Geologic, and Seismic Hazards Impacts Investigation would be prepared to further inform the design of the project. All new structures included as part of Alternative 4 would be designed and constructed to comply with the seismic design criteria identified in the United Facilities Criteria (UFC), the Naval Facilities Engineering Systems Command (NAVFAC) P-355 Seismic Design Manual, and the criteria identified in the latest design specifications of the Structural Engineering Association of California. Standard seismic engineering design would be used to minimize potential effects of seismically-induced ground movement and severe shaking.

iii. Seismic-related ground failure, including liquefaction. OTC is considered vulnerable to liquefaction due to the presence of relatively shallow groundwater and loose artificial fill, alluvium, estuarine deposits, and bay deposits (SANDAG, 2020b; City of San Diego, 2008b). As discussed above, a Geotechnical, Geologic, and Seismic Hazards Impacts Investigation would be prepared to further inform the design of the project. If needed, measures identified in the geotechnical investigation would be implemented to minimize associated impacts from liquefaction. These measures may include (1) in-situ ground improvement methods (e.g., densification or solidification), (2) transferring of load to underlying bearing layers that are non-liquefiable, or (3) excavation of susceptible soils and replacement with compacted engineered fill (SANDAG, 2014). All new structures included as part of Alternative 4 would be designed and constructed to comply with the seismic design criteria identified in the UFC, the NAVFAC P-355 Seismic Design Manual, and the criteria identified in the latest design specifications of the Structural Engineering Association of California. Standard seismic engineering design would be used to minimize potential effects of seismically-induced ground movement such as lateral spreading or liquefaction.

iv. Landslides. There would be minimal alteration of existing topography and construction would occur on previously developed surfaces. Because the site is flat, there would not be an increased potential for landslides.

Therefore, construction under Alternative 4 would result in less than significant impacts due to rupture of known earthquake faults, ground shaking or failure, liquefaction, or landslides.

Operations

Less than significant impact. There would be no additional disturbance of topography, geology, or soils following construction. As described under construction, the location of facilities, project design, and construction would be based on all engineering recommendations detailed in the Faulting, Seismicity, and Geologic Hazards Investigation; the Geotechnical, Geologic, and Seismic Hazards Impacts Investigation; and the Fault Surface Rupture Displacement Hazard Investigation (if an active fault is identified within OTC) (SANDAG, 2020b). All new structures would be designed and constructed to comply with the seismic design criteria identified in the UFC, the NAVFAC P-355 Seismic Design Manual, and the criteria identified in the latest design specifications of the Structural Engineering Association of California. Therefore, operations under Alternative 4 would result in less than significant impacts due to rupture of known earthquake faults, ground shaking or failure, liquefaction, or landslides.

Mitigation Measures and Residual Impacts

Less than significant impacts would occur for this criterion, so no mitigation measures are required. Therefore, there would be no residual impacts.

GEO-b: Result in substantial soil erosion or the loss of topsoil?

Construction

Less than significant impact. For construction-related earthwork that could increase the potential for erosion, appropriate erosion control using best management practices (BMPs) would be implemented in accordance with a project-specific construction Stormwater Pollution Prevention Plan and in compliance with coverage under the Construction General Permit. Erosion and sedimentation controls would be monitored and maintained during construction and for 12 months thereafter to ensure stabilization of the site. With implementation of BMPs there would be a minimal, temporary risk of on-site soil erosion during construction under Alternative 4. Therefore, construction under Alternative 4 would result in less than significant impacts due to soil erosion or loss of topsoil.

Operations

Less than significant impact. There would be no additional disturbance of topography or soils following construction. The facility Stormwater Pollution Prevention Plan and associated BMPs would be updated to minimize erosion of soils in compliance with the Navy Waste Discharge Requirement (see Section 2.13.1.3). Therefore, operations under Alternative 4 would result in less than significant impacts due to soil erosion or loss of topsoil.

Mitigation Measures and Residual Impacts

Less than significant impacts would occur for this criterion, so no mitigation measures are required. Therefore, there would be no residual impacts.

GEO-c: Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse?

Construction

Less than significant impact. There would be minimal alteration of existing topography and construction would occur on previously developed surfaces. Because the site is flat there would not be an increased potential for on- or off-site landslides.

Lateral spreading is a liquefaction-related phenomenon in areas of gently sloping and or free face conditions (SANDAG, 2014). Due to the project site being located on relatively flat terrain, the risk of lateral spreading in the project area is considered to be low. However, the susceptibility of the project sites to liquefaction and lateral spreading would need to be determined through a Geotechnical, Geologic, and Seismic Hazards Impacts Investigation. Slopes and free faces planned for this project would need to be designed accounting for the potential of lateral spreading (SANDAG, 2020b). If needed, measures identified in the geotechnical investigation would be implemented to minimize associated impacts from lateral spreading and liquefaction. Measures for lateral spread may include (1) in-situ ground improvement methods (e.g., densification or solidification), (2) designing the foundation to resist horizontal permanent ground displacement, or (3) subsurface barrier walls (SANDAG, 2014). Measures for liquefaction may include (1) in-situ ground improvement methods (e.g., densification or solidification), (2) transferring of load to underlying bearing layers that are non-liquefiable, or (3) excavation of susceptible soils and replacement with compacted engineered fill (SANDAG, 2014). All new structures would be designed and constructed to comply with the seismic design criteria identified in the UFC, the NAVFAC P-355 Seismic Design Manual, and the criteria identified in the latest design specifications of the Structural Engineering Association of California. Standard seismic engineering design would be used to minimize potential effects of lateral spreading and liquefaction.

Large-scale subsidence due to fluid withdrawal (water or oil) would not be an issue because OTC does not overlie an actively pumped groundwater aquifer or an oil field (Wilson Geosciences Inc., 2011). Excavations deeper than 10 to 15 feet are expected to encounter groundwater. The need for dewatering would be determined during project design and informed by the results of the geotechnical investigations. Large-scale dewatering during construction is not recommended due to the potential concerns with environmental remediations and the resulting subsidence (SANDAG, 2020b). If needed, groundwater could be controlled during construction by barrier walls or other engineering designs as recommended by the geotechnical investigation. As a result, potential for impacts related to subsidence would be less than significant.

Compressible soils are materials that are prone to a reduction in volume when subjected to loading. Additional settlement may be triggered when loads from newly constructed facilities are placed directly on top of the ground surface. The impact of compressible soils on deep foundations (such as additional down drag loads) would need to be considered in the design of the deep foundations (SANDAG, 2020b). A geotechnical investigation would be conducted to determine if the artificial fill or deeper soils and sediment deposits at OTC are compressible soils. If needed, measures identified in the geotechnical investigation would be implemented to minimize impacts from compressible soils. These measures may include (1) in-situ densification of compressible soils, (2) transferring of load to underlying non-compressible layers (i.e., through the use of pile or drilled shaft foundations), and (3) surcharging or excavation of compressible soils and replacement with compacted engineered fill (SANDAG, 2014).

Therefore, construction under Alternative 4 would result in less than significant impacts due to unstable geologic units or soils.

Operations

Less than significant impact. There would be no additional disturbance of geologic units or soils following construction. Therefore, operations under Alternative 4 would result in less than significant impacts due to unstable geologic units or soils.

Mitigation Measures and Residual Impacts

Less than significant impacts would occur for this criterion, so no mitigation measures are required. Therefore, there would be no residual impacts.

GEO-d: Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?

Construction

Less than significant impact. Soils in the project area are classified as artificial fill with properties that may include high shrink-swell potential (i.e., expansive soils). Geotechnical investigations performed in the past at OTC Site 1 (Ninyo & Moore Geotechnical and Environmental Sciences Consultants, 2002; Hushmand Associates, Inc., 2014) determined that soils from artificial fill have a high sand content and these are anticipated to have a low expansion potential (SANDAG, 2014). However, a geotechnical investigation would need to be performed to determine the specific soil properties for other areas within OTC Site 1 and OTC Site 2. If needed, measures identified in the geotechnical investigation would be implemented to minimize associated impacts from expansive soils. These measures may include (1) drainage-control devices to limit water infiltration near foundation, (2) excavation of expansive soils and replacement with compacted engineered fill, and (3) support of the new structures on piles that are designed to resist impacts of expansive soils (SANDAG, 2014). Therefore, construction under Alternative 4 would result in less than significant impacts due to expansive soils.

Operations

Less than significant impact. There would be no additional excavation or disturbance of soils following construction. Therefore, operations under Alternative 4 would result in less than significant impacts due to expansive soils.

Mitigation Measures and Residual Impacts

Less than significant impacts would occur for this criterion, so no mitigation measures are required. Therefore, there would be no residual impacts.

GEO-e: Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater?

Construction and Operations

No impact. The site is currently served by underground sewer lines that flow into the City of San Diego sewer system and wastewater treatment plant. Following construction, wastewater from the site would continue to be served by the City of San Diego sewer and wastewater treatment system. As a result, Alternative 4 would not require the use of a septic system or alternative wastewater disposal system. Therefore, construction and operations under Alternative 4 would result in no impact associated with the capability of soil to support the use of septic tanks or alternative wastewater disposal systems.

Mitigation Measures and Residual Impacts

No impacts would occur for this criterion, so no mitigation measures are required. Therefore, there would be no residual impacts.

GEO-f: Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Construction

No impact. The area under OTC consists of artificial fill. Artificial fill materials are considered to have no paleontological resource sensitivity because the material has been disturbed and no longer has stratigraphic/geological context (San Diego Natural History Museum, 2013). The alluvial floodplain and marine deposits underlying the artificial fill, which are relatively young in age and/or have a high-energy depositional history, are unlikely to produce unique fossil remains, rarely produce fossil remains of scientific significance, and have low sensitivity for fossils (County of San Diego, 2007). Additionally, there are no unique geologic features at OTC. Therefore, construction under Alternative 4 would result in no impact to paleontological resources or unique geologic features.

Operations

No impact. There would be no additional disturbance of geologic features following construction. Therefore, operations under Alternative 4 would result in no impact to paleontological resources or unique geologic features.

Mitigation Measures and Residual Impacts

No impacts would occur for this criterion, so no mitigation measures are required. Therefore, there would be no residual impacts.

MIN-a: Result in the loss of availability of a known mineral resource that would be a value to the region and the residents of the state?

Construction

No impact. There are no potentially developable mineral resource deposits present at OTC or in the vicinity of the project area (California Department of Conservation, 1996). Therefore, construction under Alternative 4 would result in no impact to mineral resources.

Operations

No impact. There would be no additional disturbance of topography, geology, or soils following construction. Therefore, operations under Alternative 4 would result in no impact to mineral resources.

Mitigation Measures and Residual Impacts

No impacts would occur for this criterion, so no mitigation measures are required. Therefore, there would be no residual impacts.

MIN-b: Result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan?

Construction

No impact. There are no potentially developable mineral resource deposits present at OTC or in the vicinity of the project area (California Department of Conservation, 1996). In addition, there are no locally important mineral resource recovery sites identified on OTC or the vicinity. Therefore, construction under Alternative 4 would result in no impact to locally important mineral resources.

Operations

No impact. There would be no additional disturbance of topography, geology, or soils following construction. Therefore, operations under Alternative 4 would result in no impact to locally important mineral resources.

Mitigation Measures and Residual Impacts

No impacts would occur for this criterion, so no mitigation measures are required. Therefore, there would be no residual impacts.

2.12.1.4 Alternative 5 Impacts

Construction and Operations

Impacts determinations for geology, soils, and mineral resources under Alternative 5 would be similar to those under Alternative 4, but the development scenario for private development would be reduced. The lower density development under Alternative 5 would result in reduced construction impacts compared to Alternative 4. Therefore, construction and operations under Alternative 5 would have no impacts or less than significant impacts for each of the significance criteria for geology, soils, or mineral resources.

Mitigation Measures and Residual Impacts

No impacts or less than significant impacts would occur for this criterion, so no mitigation measures are required. Therefore, there would be no residual impacts.

2.12.2 Cumulative Impacts

2.12.2.1 Description of Geographic Study Area

The ROI for geological resources under Alternatives 4 and 5 consists of OTC, the Old Town and Uptown community planning areas, San Diego International Airport, Harbor Island, and the regional plans summarized in Table 4.3-1 of the EIS.

2.12.2.2 Relevant Past, Present, and Future Actions

A majority of the construction projects listed in Tables 4.3-1 and 4.3-2 of the EIS would involve ground disturbance or vegetation removal. As such, they have the potential to cumulatively impact geological resources by disrupting soil surfaces, causing compaction and erosion, or altering topography in the ROI. The projects identified in Tables 4.3-1 and 4.3-2 of the EIS also have the potential to be affected by seismic events.

2.12.2.3 Cumulative Impact Analysis

Impacts to geological resources have the tendency to be site-specific and do not usually accumulate. However, without proper controls, erosion and sediment deposition could potentially migrate off-site and accumulate over time. The analysis presented in Sections 2.1.1.3 and 2.1.1.4 concluded that with the implementation of proper seismic design, soil erosion programs, and a project-specific Stormwater Pollution Prevention Plan with associated BMPs, implementation of Alternatives 4 or 5 would result in less than significant impacts to following significance criteria and cumulative analysis is presented below:

GEO-a: Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:

i. **Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map, issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.**

ii. **Strong seismic ground shaking?**

iii. **Seismic-related ground failure, including liquefaction?**

iv. **Landslides?**

As described in Sections 2.1.1.3 and 2.1.1.4, the location of facilities, project design, and construction under Alternatives 4 or 5 would be based on engineering recommendations detailed in the Faulting, Seismicity, and Geologic Hazards Investigation; the Geotechnical, Geologic, and Seismic Hazards Impacts Investigation; and the Fault Surface Rupture Displacement Hazard Investigation (if an active fault is identified within the OTC). For many cumulative projects involving new construction, similar geotechnical investigations may also be conducted to determine fault locations and other seismic hazards. Site-specific seismic engineering and design standards would be implemented for Alternatives 4 or 5 and other cumulative projects to minimize impacts from anticipated fault rupture, strong seismic ground shaking, subsequent effects such as liquefaction, and landslides. Specifically, structures would be constructed to comply with all applicable codes and regulations, to include the California Building Code, City of San Diego Municipal Code, the Alquist-Priolo Earthquake Fault Zoning Act, the UFC, the NAVFAC P-355 Seismic Design Manual, and the criteria identified in the latest design specifications of the Structural Engineering Association of California, as applicable. Therefore, when combined with past, present, and reasonably foreseeable future projects, implementation of Alternatives 4 or 5 would result in less than significant cumulative impacts due to rupture of known earthquake faults, ground shaking or failure, liquefaction, or landslides.

GEO-b: Result in substantial soil erosion or the loss of topsoil?

Construction activities under Alternatives 4 or 5 and nearby cumulative projects would increase soil susceptibility to erosion, compaction, and displacement. For all construction projects that disturb over 1 acre (including Alternatives 4 or 5), appropriate erosion control BMPs would be implemented in accordance with a project-specific construction Stormwater Pollution Prevention Plan, and in compliance with coverage under the Construction General Permit. There would be no additional disturbance of soils following construction and facilities would comply with National Pollutant Discharge Elimination System permit requirements. Therefore, when combined with past, present, and reasonably foreseeable future projects, implementation of Alternatives 4 or 5 would result in less than significant cumulative impacts due to soil erosion or loss of topsoil.

GEO-c: Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse?

Construction activities under Alternatives 4 or 5 and many nearby cumulative projects that result in minimal alteration of existing topography or are located in relatively flat areas would have a low risk of landslides and lateral spreading. Geotechnical investigations for Alternatives 4 or 5 and individual cumulative projects would consider potential for landslides, lateral spreading, subsidence, liquefaction, or collapse (e.g., form compressible soils). As described in Sections 2.1.1.3 and 2.1.1.4, these projects would implement any measures identified in geotechnical investigations to minimize associated impacts from unstable geologic units or soils. There would be no additional disturbance of geologic units or soils following construction. Therefore, when combined with past, present, and reasonably foreseeable future projects, implementation of Alternatives 4 or 5 would result in less than significant cumulative impacts due to unstable geologic units or soils.

GEO-d: Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?

Construction activities under Alternatives 4 or 5 and nearby cumulative projects may occur in expansive soils. Geotechnical investigations for Alternatives 4 or 5 and individual cumulative projects would be conducted to determine the specific soil properties at a project site and any recommended measures would be implemented to minimize associated impacts from expansive soils. There would be no additional excavation or disturbance of soils following construction. Therefore, when combined with past, present, and reasonably foreseeable future projects, implementation of Alternatives 4 or 5 would result in less than significant cumulative impacts due to expansive soils.

2.12.2.4 Other Significance Criteria

As discussed in Sections 2.12.1.3 and 2.12.1.4, Alternatives 4 or 5 would not require the use of a septic system or alternative wastewater disposal system and there are no potentially developable mineral resource deposits, paleontological resources, or agriculturally productive soils at OTC. Therefore, Alternatives 4 or 5 would have no cumulative impact on these resources, and following significance criteria are not evaluated further:

- GEO-e: Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater?
- GEO-f: Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?
- MIN-a: Result in the loss of availability of a known mineral resource that would be a value to the region and the residents of the state?
- MIN-b: Result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan?

2.13 Hydrology/Water Quality

Hydrology and water quality include groundwater, surface water, and floodplains. Descriptions of the regulatory setting, environmental setting, and assessment methodology are presented in Sections 3.15.1, 3.15.2, and 3.15.3 of the EIS, respectively.

2.13.1 Impacts Determination

This section focuses on activities of the Alternatives 4 and 5 that could have environmental consequences for hydrology and water quality.

2.13.1.1 Impacts Summary

Table 2.13-1 presents a summary of impacts related to hydrology/water quality for each criterion specified in CEQA Appendix G Environmental Checklist Form. Explanation of each impact conclusion is provided in the following subsections.

Table 2.13-1 Impacts Related to Hydrology/Water Quality

Criteria	*Potentially Significant*	*Less than Significant with Mitigation*	*Less than Significant*	*No Impact*
X. HYDROLOGY AND WATER QUALITY (WQ-) Would the project:	-	-	-	-
a) Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality?	-	-	**X**	-
b) Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?	-	-	**X**	-
c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:	-	-	-	-

Criteria	Potentially Significant	Less than Significant with Mitigation	Less than Significant	No Impact
i. result in a substantial erosion or siltation on- or off-site;	-	-	X	-
ii. substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site;	-	-	X	-
iii. create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or	-	-	X	-
iv. impede or redirect flood flows?	-	-	X	-
d) In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation?	-	-	-	X
e) Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?	-	-	-	X

Legend: - = no data in cell; X = selection for Alternatives 4 and 5.

2.13.1.2 No Action/No Project Alternative Impacts

The impacts of the No Action Alternative on hydrology and water quality are discussed in Section 3.15.3.1 of the EIS, *Water Resources*. The No Action Alternative would result in no impacts to hydrology and water quality.

2.13.1.3 Alternative 4 Impacts

WQ-a: Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality?

Construction

Less than significant impact. Construction activities associated with Alternative 4 would not generate point source waste streams other than stormwater discharges. However, it is possible that construction activities could require groundwater dewatering, which would generate a need for discharging the dewatering effluent. If required, the Navy would obtain a dewatering permit, and dewatering effluent would be disposed of in accordance with Regional Water Quality Control Board Order R9-2014-0041-Waiver Number 3 (Low Threat Discharge to Land for Short-Term Construction Dewatering).

Construction would be subject to the Construction General Permit (*General Permit for Storm Water Discharges Associated with Construction and Land Disturbance Activities*; SWRCB Order No 2009-0009-DWQ amended 2010-0014-DWQ and by 2012-0006-DWQ, National Pollutant Discharge Elimination System Permit No. CAS000002; SWRCB 2009). The Construction General Permit requires dischargers to ensure that stormwater discharges do not contain pollutants that cause or contribute to an exceedance of any applicable water quality objectives or water quality standards contained in a Statewide Water Quality Control Plan, the California Toxics Rule, the National Toxics Rule, or the applicable Regional Water Board's Water Quality Control Plan (Basin Plan). Construction would comply with limits specified in the permit, thereby ensuring that construction activities do not violate water quality standards or degrade surface or groundwater quality.

Operations

Less than significant impact. Similar to construction activities, operations would not generate point source waste streams other than stormwater discharges. Stormwater discharges from OTC would be regulated under the Navy's Waste Discharge Requirement permit (Regional Water Quality Control Board Order No. R9-2014-0037, as Amended by Order No. N9-2017-0010, National Pollutant Discharge Elimination System Permit No. CA0109363 – Waste Discharge Requirements for United States Department of the Navy), which would be modified as appropriate to reflect post-construction changes to the stormwater facilities and characteristics of the runoff. Post-construction activities would require adherence to the facility Stormwater Pollution Prevention Plan that includes impact avoidance and minimization measures. By successfully complying with these measures, runoff during post-construction operations would be minimized and treated through low impact development, site design, and/or structural BMPs mandated by these measures. According to Navy (2020a), there have not been any recent notices of violation or non-compliance with the existing stormwater discharge permit. Consolidation of transit on OTC would not adversely affect water resources because construction and operations would comply with the Construction General Permit and Waste Discharge Requirement permit that specify development of plans (stormwater management and stormwater pollution prevention plans), implementation of best available pollutant control technology and BMPs, and monitoring and reporting requirements necessary to meet water quality criteria and protect the beneficial uses of water resources. Therefore, Alternative 4 operations would not violate water quality standards or degrade surface or groundwater quality.

Mitigation Measures and Residual Impacts

Less than significant impacts would occur for this criterion, so no mitigation measures are required. Therefore, there would be no residual impacts.

WQ-b: Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?

Construction and Operations

Less than significant impact. As noted in Section 3.15.2.1 of the EIS, groundwater is not a source of potable water at OTC, and there are no known drinking water wells within a 1-mile radius of OTC (Navy, 2020b). Further, per the Basin Plan (Regional Water Quality Control Board, 2016), the San Diego Mesa Hydrologic Area that includes OTC has no designated beneficial uses.

Ground-disturbing activities during construction could encounter groundwater and require dewatering. However, the volume of groundwater extracted would be limited and would not affect or deplete groundwater supplies. OTC is almost entirely covered by impervious surfaces, so current infiltration rates and the potential for groundwater recharge are minimal (see Section 3.15.2.1 of the EIS). Post-construction, the portion of the site covered by impervious surfaces is not expected to increase. Low impact development features would be incorporated as part of the sustainable design of new buildings, and these features would promote greater on-site retention of rainfall (decreased runoff volumes). Regardless, this would not represent a substantial change in the groundwater recharge potential for the site.

Therefore, construction and operations of Alternative 4 would not interfere with a source for drinking water or with management of a groundwater resource.

Mitigation Measures and Residual Impacts

Less than significant impacts would occur for this criterion, so no mitigation measures are required. Therefore, there would be no residual impacts.

WQ-c: Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:

- **i. result in substantial erosion or siltation on- or off-site**
- **ii. substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site**
- **iii. create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff**
- **iv. impede or redirect flood flows**

Construction and Operations

Less than significant impact. OTC is relatively flat, and construction and operations of Alternative 4 would not require significant re-grading that would substantially alter runoff flow volumes or new construction with the potential for redirecting drainage patterns. Further, an estimated 95 percent of the OTC presently is covered with an impervious surface (represented by the building footprints, paved parking lots, and access roads) (Regional Water Quality Control Board, 2014). Once constructed, the portion of OTC covered with an impervious surface would be similar to or less than existing conditions. Thus, construction and operations would not increase the amount of impervious surface to an extent that would result in appreciably greater runoff volumes.

There are no surface water features, including streams or creeks, within or adjacent to OTC. Therefore, construction and operations would not alter the course of surface water flows or result in substantial erosion or siltation on- or off-site. Thus, construction and operations of Alternative 4 would not alter drainage patterns, increase flood risks, or promote erosion or siltation.

Mitigation Measures and Residual Impacts

Less than significant impacts would occur for this criterion, so no mitigation measures are required. Therefore, there would be no residual impacts.

WQ-d: In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation?

Construction and Operations

No impact. OTC is not located in a flood zone and is not subject to tsunami or seiche run-up.

Mitigation Measures and Residual Impacts

No impacts would occur for this criterion, so no mitigation measures are required. Therefore, there would be no residual impacts.

WQ-e: Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?

Construction and Operations

No impact. As noted previously, OTC is within San Diego Mesa Hydrologic Area (groundwater basin) that has no designated beneficial uses. Construction and operations would not conflict or interfere with a groundwater management plan. As discussed in Section 3.15.2.2 of the EIS, the San Diego River represents receiving waters for stormwater runoff discharges from OTC Site 1. The lower portion of the San Diego River is on the current 303(d) list as an impaired water body. However, stormwater runoff discharges from OTC have not been identified as a contributing source to the impairment. Therefore, construction and operations of Alternative 4 would not conflict with ongoing total maximum daily loads and other water quality plans for the San Diego River. Similarly, San Diego Bay represents receiving waters for stormwater runoff discharges from OTC Site 2, and San Diego Bay is on the current 303(d) list as an impaired water body. Stormwater runoff discharges from OTC have not been identified as a contributing source to the impairment. Therefore, construction and operations of Alternative 4 would not conflict with ongoing total maximum daily loads and other water quality plans for San Diego Bay.

Mitigation Measures and Residual Impacts

No impacts would occur for this criterion, so no mitigation measures are required. Therefore, there would be no residual impacts.

2.13.1.4 Alternative 5 Impacts

Construction and Operations

Impacts determinations for hydrology and water quality under Alternative 5 would be identical to those under Alternative 4 (Section 2.13.1.3). Therefore, Alternative 5 would have no impacts or less than significant impacts for each of the significance criteria for water resources.

Mitigation Measures and Residual Impacts

Impact avoidance and minimization measures (design features such as low impact development) discussed in the EIS would ensure that any potential impacts to water resources would be less than significant. No significant impacts would occur for this criterion, so no mitigation measures are required. Therefore, there would be no residual impacts.

2.13.2 Cumulative Impacts

2.13.2.1 Description of Geographic Study Area

The ROI for water resources includes the surface water and groundwater features that could be subject to direct or indirect effects from implementation of the Proposed Action Alternatives. As discussed in

Section 3.15 of the EIS, *Water Resources*, there are no surface water features within or adjacent to OTC. The closest surface water features to OTC are the San Diego River and San Diego Bay, located approximately 0.5 and 0.75 mile, respectively from OTC. The Proposed Action Alternatives would discharge stormwater runoff via outfalls to the San Diego River and to San Diego Bay; therefore, the lower portions of the San Diego River and San Diego Bay in the vicinity of the Naval Training Center Boat Channel are included in the ROI. The ROI for groundwater resources consists of the portion of the San Diego Mesa Hydrologic Area groundwater basin immediately beneath OTC.

2.13.2.2 Relevant Past, Present, and Future Actions

Relevant past, present, and reasonably foreseeable actions that might interact with the Proposed Action Alternatives to affect water resources are those with the potential to:

- Result in a substantial increase in runoff volumes and/or alterations of drainage patterns that could result in flooding.
- Substantially degrade the quality of surface or receiving waters.
- Reduce supplies or alter beneficial uses of groundwater.

Of the past, present, and reasonably foreseeable actions listed in Tables 4.3-1 and 4.3-2 of the EIS, only those located within the same watershed as OTC would have potential for contributing to cumulative impacts related to runoff volumes or drainage patterns. These cumulative projects include the miscellaneous projects and construction of pre-engineered buildings at OTC; Marine Corps Community Services car wash project at Marine Corps Recruit Depot San Diego; SANDAG transportation projects that traverse the watershed; various Port of San Diego projects; and miscellaneous projects at San Diego International Airport, Liberty Station, and the Sports Arena that are near OTC. All other actions are outside of the watershed and would not affect runoff patterns in the vicinity of OTC.

Similarly, only past, present, and future actions that involve or could involve discharges, including stormwater runoff, to the San Diego River and San Diego Bay would have potential for contributing to cumulative impacts related to surface water quality. These cumulative projects include: City of San Diego community plans and actions; SANDAG transportation projects that traverse the watershed, such as coastal rail improvements; and regional water quality improvement plans and projects, such as the Regional Water Quality Board’s Total Maximum Daily Load for Indicator Bacteria, Project 1 – Twenty Beaches and Creeks in the San Diego Region. Additionally, the San Diego Bay Watershed Water Quality Improvement Plan (City of San Diego, 2016d) was developed to guide responsible parties within the San Diego Bay Watershed toward achieving improved water quality in municipal stormwater discharges as well as improve communication between non-municipal entities within the San Diego Bay Watershed (e.g., the Navy) and the appropriate regulatory agencies to ensure that discharges are appropriately regulated and to improve water quality throughout the San Diego Bay Watershed. Similarly, the Water Quality Improvement Plan for the San Diego River Watershed includes a Jurisdictional Urban Runoff Management Plan that specifies BMPs and monitoring requirements related to improving water quality in the San Diego River.

Groundwater associated with the San Diego Mesa Hydrologic Area that includes OTC has no designated beneficial uses. Thus, it is unlikely that any of the present and future actions would include requirements for extracting or discharge to groundwater with the potential for affecting supplies or altering beneficial uses.

2.13.2.3 Alternatives 4 and 5

Alternatives 4 and 5 would have less than significant impacts or no impact to the significance criteria presented in 2.13.1.1. Alternatives 4 and 5 would not contribute to cumulative changes to violating any water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality; substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin; or substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces.

Current and future development project in the ROI would be required to comply with all National Pollution Discharge Elimination System permit requirements, including the development of a Stormwater Pollution Prevention Plan if the disturbed area covers one acre or more. Compliance with permit conditions, together with implementation and maintenance of BMPs, would result in less than significant cumulative impacts to hydrology/water quality.

2.14 Biological Resources

Biological resources generally include plant and animal species and the habitats in which they occur. Plant associations are generally referred to as *vegetation* and animal species are referred to as *wildlife*. Habitat is defined as the resources and conditions present in an area that support plant and wildlife species. A description of regulatory setting, environmental setting, and assessment methodology are presented in Sections 3.16.1, 3.16.2, and 3.16.3 of the EIS, respectively. This analysis focuses on species that are important to the function of ecosystems, are of special societal importance, or are protected under federal or state law or statute.

2.14.1 Impacts Determination

This section focuses on activities of Alternatives 4 and 5 that could have environmental consequences for biological resources.

2.14.1.1 Impacts Summary

Table 2.14-1 presents a summary of impacts related to biological resources for each criterion specified in CEQA Appendix G Environmental Checklist Form. Explanation of each impact conclusion is provided in the following subsections.

Table 2.14-1 Impacts Related to Biological Resources

Criteria	*Potentially Significant*	*Less than Significant with Mitigation*	*Less than Significant*	*No Impact*
IV. BIOLOGICAL RESOURCES (BIO-) Would the project:	-	-	-	-
a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?	-	-	**X**	-
b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or	-	-	-	**X**

Criteria		Potentially Significant	Less than Significant with Mitigation	Less than Significant	No Impact
	regional plans, policies, regulations or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?				
c)	Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?	-	-	-	X
d)	Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?	-	-	X	-
e)	Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?	-	-	-	X
f)	Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?	-	-	-	X

Legend: - = no data in cell; X = selection for Alternatives 4 and 5.

2.14.1.2 No Action/No Project Alternative Impacts

The impacts of the No Action Alternative for biological resources are described in Section 3.16.3.1 of the EIS, *Biological Resources*. The No Action Alternative would result in less than significant impacts to biological resources.

2.14.1.3 Alternative 4 Impacts

BIO-a: Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?

Construction and Operations

Less than significant impact. As discussed in Section 3.16.2 of the EIS, there is a low likelihood for bird and bat species that are recognized as species of special concern by the California Department of Fish and Wildlife to occur transiently in the project area or to roost/nest in existing structures or buildings. Project design features, including pre-construction roosting/nesting bird and bat surveys, avoidance, and/or exclusion, would limit any potential impacts to wildlife species, including bird and bat species identified as species of special concern by the California Department of Fish and Wildlife. In addition, no federally listed species are known to occur in or utilize the project area, and no potential habitat for federally listed species occurs in the project area (refer to Section 3.16.2 of the EIS). Therefore, under Alternative 4, no federally listed species would be impacted during construction and operations.

Mitigation Measures and Residual Impacts

Significant impacts would not occur for this criterion, so no mitigation measures are required. Therefore, residual impacts are the same as the impacts described above.

BIO-b: Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?

Construction and Operations

No impact. No naturally occurring plant communities or habitats occur in the project area (refer to Section 3.16.2 of the EIS). The entire project area is developed, and no natural habitats would be directly or indirectly impacted in or in the vicinity of the project area.

Mitigation Measures and Residual Impacts

Significant impacts would not occur for this criterion, so no mitigation measures are required. Therefore, residual impacts are the same as the impacts described above.

BIO-c: Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Construction and Operations

No impact. No wetlands or other waters occur in the project area, and no wetlands or other waters would be indirectly affected in the vicinity of the project area (refer to Section 3.15.3 of the EIS, *Water Resources*). Although stormwater drainages in the vicinity of OTC discharge to San Diego Bay, coastal waters would not be significantly impacted (refer to Section 3.15.3 of the EIS, *Water Resources*), and the project area does not occur in the coastal zone.

Mitigation Measures and Residual Impacts

Significant impacts would not occur for this criterion, so no mitigation measures are required. Therefore, residual impacts are the same as the impacts described above.

BIO-d: Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Construction and Operations

Less than significant impact. No marine or other aquatic habitats would be directly impacted, and any indirect impacts would be less than significant (refer to Section 3.15.3 of the EIS, *Water Resources*). The project area is completely developed and provides little to no habitat or resources for wildlife species (refer to Section 3.16.2 of the EIS, *Biological Resources*). Therefore, wildlife occurrences within the project area are largely transitory in nature (e.g., bird or bat overflights or small mammals transiting the project area). Project design features, including pre-construction roosting/nesting bird and bat surveys and bat- and bird-friendly building design and standards, would limit any potential impacts to wildlife species during both the construction and operations phases.

Mitigation Measures and Residual Impacts

Significant impacts would not occur for this criterion, so no mitigation measures are required. Therefore, residual impacts are the same as the impacts described above.

BIO-e: Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Construction and Operations

No impact. The Navy is the sole owner of the project area and there are no local policies or ordinances to protect biological resources in the project area. Thus, there is no conflict with any local policies or ordinances protecting biological resources due to the implementation of Alternative 4.

Mitigation Measures and Residual Impacts

Significant impacts would not occur for this criterion, so no mitigation measures are required. Therefore, residual impacts are the same as the impacts described above.

BIO-f: Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Construction and Operations

No impact. The Navy is the sole owner of the project area and natural resources at Naval Base Point Loma OTC are managed under an existing Integrated Natural Resources Management Plan. Therefore, there would not be a conflict with an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan.

Mitigation Measures and Residual Impacts

Significant impacts would not occur for this criterion, so no mitigation measures are required. Therefore, residual impacts are the same as the impacts described above.

2.14.1.4 Alternative 5 Impacts

Construction and Operations

Impacts determinations for biological resources under Alternative 5 would be identical to those under Alternative 4 (Section 2.14.1.3). Therefore, Alternative 5 would have no impacts or less than significant impacts for each of the significance criteria for biological resources.

Mitigation Measures and Residual Impacts

Significant impacts would not occur for this criterion, so no mitigation measures are required. Therefore, residual impacts are the same as the impacts described above.

2.14.2 Cumulative Impacts

2.14.2.1 Description of Geographic Study Area

The ROI for biological resources includes the OTC and immediately surrounding areas potentially exposed to noise or visual impacts during construction and operations.

2.14.2.2 Relevant Past, Present, and Future Actions

The past, present, and reasonably foreseeable future projects that have the most potential to contribute to cumulative biological resource effects when combined with the Proposed Action Alternatives include the City of San Diego Community Plans and Projects, SANDAG Plans and Projects, Port of San Diego Projects, and Miscellaneous Plans and Projects.

Cumulative Impact Analysis

The analysis presented in Sections 2.14.1.3 and 2.14.1.4 concluded that the combined effects of construction and operations under Alternatives 4 and 5 would not result in significant impacts on biological resources, including special status species. The Proposed Action Alternatives would have no impacts on natural habitats.

2.14.2.3 Alternatives 4 and 5

Alternatives 4 and 5 would have no impacts on or related to natural habitats, habitat fragmentation, or federally listed species. All proposed activities would occur on previously developed land, in a highly urbanized setting. Proposed construction, repair, renovation, and/or demolition activities would result in minimal direct impacts on wildlife species from increased noise, human presence, and night-lighting. Mammal and bird species that may transit the area would likely avoid the project area. The implementation of proposed management practices (Section 3.16.3.7 of the EIS, *Biological Resources*) would further greatly reduce the potential to directly or indirectly impact wildlife, roosting/nesting birds and bats, or special status species, that may occur in or near the project area. The analysis presented above concluded that the combined effects of construction and operations under Alternatives 4 and 5 would not result in significant impacts on biological resources.

Cumulatively, while any project may have the potential to impact individual species and habitat, the overall distribution or abundance of populations and habitats and ecosystem functions and values would not be significantly affected. Other ongoing and reasonably foreseeable construction and infrastructure projects are likely to result in localized habitat loss and minor impacts on biological resources, while project-related restoration/mitigation is likely to offset some past habitat loss and improve habitat for biological resources.

Ongoing and future natural resources management activities on DoD-owned lands and lands administered by the City of San Diego, the Port of San Diego, and other entities would protect and benefit biological resources in the region, including federally listed species, birds protected under the Migratory Bird Treaty Act, and species designated as California species of special concern. Alternatives 4 and 5 in conjunction with the identified cumulative projects may elicit temporary behavioral responses in small numbers of wildlife species; however, species would not be impacted at a population level.

Cumulative biological resources impacts from past, present, and reasonably foreseeable actions within the ROI would be less than significant because those projects that may potentially impact biological resources would implement management practices, mitigation measures, and/or regulatory guidelines to limit impacts to habitats and species. Therefore, implementation of Alternatives 4 or 5, when combined with the past, present, and reasonably foreseeable future projects would not result in significant cumulative impacts to biological resources within the ROI.

CAP Consistency Checklist Submittal Application

This page intentionally left blank.

CLIMATE ACTION PLAN CONSISTENCY CHECKLIST INTRODUCTION

In December 2015, the City adopted a Climate Action Plan (CAP) that outlines the actions that City will undertake to achieve its proportional share of State greenhouse gas (GHG) emission reductions. The purpose of the Climate Action Plan Consistency Checklist (Checklist) is to, in conjunction with the CAP, provide a streamlined review process for proposed new development projects that are subject to discretionary review and trigger environmental review pursuant to the California Environmental Quality Act (CEQA).[1]

Analysis of GHG emissions and potential climate change impacts from new development is required under CEQA. The CAP is a plan for the reduction of GHG emissions in accordance with CEQA Guidelines Section 15183.5. Pursuant to CEQA Guidelines Sections 15064(h)(3), 15130(d), and 15183(b), a project's incremental contribution to a cumulative GHG emissions effect may be determined not to be cumulatively considerable if it complies with the requirements of the CAP.

This Checklist is part of the CAP and contains measures that are required to be implemented on a project-by-project basis to ensure that the specified emissions targets identified in the CAP are achieved. Implementation of these measures would ensure that new development is consistent with the CAP's assumptions for relevant CAP strategies toward achieving the identified GHG reduction targets. Projects that are consistent with the CAP as determined through the use of this Checklist may rely on the CAP for the cumulative impacts analysis of GHG emissions. Projects that are not consistent with the CAP must prepare a comprehensive project-specific analysis of GHG emissions, including quantification of existing and projected GHG emissions and incorporation of the measures in this Checklist to the extent feasible. Cumulative GHG impacts would be significant for any project that is not consistent with the CAP.

The Checklist may be updated to incorporate new GHG reduction techniques or to comply with later amendments to the CAP or local, State, or federal law.

[1] Certain projects seeking ministerial approval may be required to complete the Checklist. For example, projects in a Community Plan Implementation Overlay Zone may be required to use the Checklist to qualify for ministerial level review. See Supplemental Development Regulations in the project's community plan to determine applicability.

This page intentionally left blank

CAP CONSISTENCY CHECKLIST SUBMITTAL APPLICATION

- The Checklist is required only for projects subject to CEQA review.[2]
- If required, the Checklist must be included in the project submittal package. Application submittal procedures can be found in Chapter 11: Land Development Procedures of the City's Municipal Code.
- The requirements in the Checklist will be included in the project's conditions of approval.
- The applicant must provide an explanation of how the proposed project will implement the requirements described herein to the satisfaction of the Planning Department.

Application Information

Contact Information

Project No./Name: Navy Old Town Campus Revitalization

Property Address: 4301 Pacific Hwy, San Diego, CA 92110

Applicant Name/Co.: Naval Information Warfare Systems Command

Contact Phone: ______ Contact Email: ______

Was a consultant retained to complete this checklist? ☐ Yes ☐ No If Yes, complete the following

Consultant Name: ______ Contact Phone: ______

Company Name: ______ Contact Email: ______

Project Information

1. What is the size of the project (acres)? 70.5
2. Identify all applicable proposed land uses:
   - ☐ Residential (indicate # of single-family units): ______
   - ■ Residential (indicate # of multi-family units): 10,000
   - ■ Commercial (total square footage): 1,890,000
   - ☐ Industrial (total square footage): ______
   - ■ Other (describe): Military: 1,064,268 sf office + lab + storage
3. Is the project or a portion of the project located in a Transit Priority Area? ■ Yes ☐ No
4. Provide a brief description of the project proposed:

The proposed project would redevelop the OTC site to contain a NAVWAR footprint and mixed use residential, office, hotel, and retail space and a transit center. The project would include demolition and construction of utilities, facilities, and infrastructure via a public-private development agreement.

[2] Certain projects seeking ministerial approval may be required to complete the Checklist. For example, projects in a Community Plan Implementation Overlay Zone may be required to use the Checklist to qualify for ministerial level review. See Supplemental Development Regulations in the project's community plan to determine applicability.

CAP CONSISTENCY CHECKLIST QUESTIONS

Step 1: Land Use Consistency

The first step in determining CAP consistency for discretionary development projects is to assess the project's consistency with the growth projections used in the development of the CAP. This section allows the City to determine a project's consistency with the land use assumptions used in the CAP.

Step 1: Land Use Consistency		
Checklist Item (Check the appropriate box and provide explanation and supporting documentation for your answer)	Yes	No
A. Is the proposed project consistent with the existing General Plan and Community Plan land use and zoning designations?;[3] OR, B. If the proposed project is not consistent with the existing land use plan and zoning designations, and includes a land use plan and/or zoning designation amendment, would the proposed amendment result in an increased density within a Transit Priority Area (TPA)[4] and implement CAP Strategy 3 actions, as determined in Step 3 to the satisfaction of the Development Services Department?; OR, C. If the proposed project is not consistent with the existing land use plan and zoning designations, does the project include a land use plan and/or zoning designation amendment that would result in an equivalent or less GHG-intensive project when compared to the existing designations?	☑	☐

If "***Yes***," proceed to Step 2 of the Checklist. For question B above, complete Step 3. For question C above, provide estimated project emissions under both existing and proposed designation(s) for comparison. Compare the maximum buildout of the existing designation and the maximum buildout of the proposed designation.

If "***No***," in accordance with the City's Significance Determination Thresholds, the project's GHG impact is significant. The project must nonetheless incorporate each of the measures identified in Step 2 to mitigate cumulative GHG emissions impacts unless the decision maker finds that a measure is infeasible in accordance with CEQA Guidelines Section 15091. Proceed and complete Step 2 of the Checklist.

The proposed project satisfies Option B. It would introduce new non-military residential and commercial land uses to the OTC site and therefore would not be consistent with the existing land use plan. The project by itself would consume most the residential growth forecasted in the Midway-Pacific Highway Community Plan, and it would exceed the employment growth forecasted in the Community Plan. The project would include a transit center and would provide mixed-use, high-density development within a TPA. The project would implement CAP Strategy 3 actions.

[3] This question may also be answered in the affirmative if the project is consistent with SANDAG Series 12 growth projections, which were used to determine the CAP projections, as determined by the Planning Department.

[4] This category applies to all projects that answered in the affirmative to question 3 on the previous page: Is the project or a portion of the project located in a transit priority area.

Step 2: CAP Strategies Consistency

The second step of the CAP consistency review is to review and evaluate a project's consistency with the applicable strategies and actions of the CAP. Step 2 only applies to development projects that involve permits that would require a certificate of occupancy from the Building Official or projects comprised of one and two family dwellings or townhouses as defined in the California Residential Code and their accessory structures.[5] All other development projects that would not require a certificate of occupancy from the Building Official shall implement Best Management Practices for construction activities as set forth in the Greenbook (for public projects).

Step 2: CAP Strategies Consistency			
Checklist Item (Check the appropriate box and provide explanation for your answer)	Yes	No	N/A
Strategy 1: Energy & Water Efficient Buildings			
1. *Cool/Green Roofs*. • Would the project include roofing materials with a minimum 3-year aged solar reflection and thermal emittance or solar reflection index equal to or greater than the values specified in the voluntary measures under California Green Building Standards Code (Attachment A)?; OR • Would the project roof construction have a thermal mass over the roof membrane, including areas of vegetated (green) roofs, weighing at least 25 pounds per square foot as specified in the voluntary measures under California Green Building Standards Code?; OR • Would the project include a combination of the above two options? Check "N/A" only if the project does not include a roof component. The project would implement management practice AQ MGMT-6, as described in EIS Section 3.1.5.9: Building construction would include either (1) roofing materials with a minimum 3-year aged solar reflection and thermal emittance or solar reflection index equal to or greater than the values specified in the voluntary measures under the 2019 or newer California Green Building Standards Code or (2) a thermal mass over the roof membrane, including areas of vegetated (green) roofs, weighing at least 25 pounds per square foot as specified in the voluntary measures under the 2019 or newer California Green Building Standards Code.	☑	☐	☐

[5] Actions that are not subject to Step 2 would include, for example: 1) discretionary map actions that do not propose specific development, 2) permits allowing wireless communication facilities, 3) special events permits, 4) use permits or other permits that do not result in the expansion or enlargement of a building (e.g., decks, garages, etc.), and 5) non-building infrastructure projects such as roads and pipelines. Because such actions would not result in new occupancy buildings from which GHG emissions reductions could be achieved, the items contained in Step 2 would not be applicable.

2. *Plumbing fixtures and fittings* With respect to plumbing fixtures or fittings provided as part of the project, would those low-flow fixtures/appliances be consistent with each of the following: Residential buildings: • Kitchen faucets: maximum flow rate not to exceed 1.5 gallons per minute at 60 psi; • Standard dishwashers: 4.25 gallons per cycle; • Compact dishwashers: 3.5 gallons per cycle; and • Clothes washers: water factor of 6 gallons per cubic feet of drum capacity? Nonresidential buildings: • Plumbing fixtures and fittings that do not exceed the maximum flow rate specified in Table A5.303.2.3.1 (voluntary measures) of the California Green Building Standards Code (See Attachment A); and • Appliances and fixtures for commercial applications that meet the provisions of Section A5.303.3 (voluntary measures) of the California Green Building Standards Code (See Attachment A)? Check "N/A" only if the project does not include any plumbing fixtures or fittings. The project would implement management practice AQ MGMT-17, as described in EIS Section 3.1.5.9: Residential buildings: (a) Kitchen faucets: maximum flow rate not to exceed 1.5 gpm at 60 psi; (b) Standard dishwashers: 4.25 gal per cycle; (c) Compact dishwashers: 3.5 gal per cycle; and (d) Clothes washers: water factor of 6 gal per cf of drum capacity. Nonresidential buildings: (a) Plumbing fixtures and fittings that do not exceed the maximum flow rate specified in Table A5.303.2.3.1 of the California Green Building Standards Code; and (b) Appliances and fixtures for commercial applications that meet the provisions of Section A5.303.3 of the California Green Building Standards Code.	☑	☐	☐

Strategy 3: Bicycling, Walking, Transit & Land Use			
3. *Electric Vehicle Charging* • Multiple-family projects of 17 dwelling units or less: Would 3% of the total parking spaces required, or a minimum of one space, whichever is greater, be provided with a listed cabinet, box or enclosure connected to a conduit linking the parking spaces with the electrical service, in a manner approved by the building and safety official, to allow for the future installation of electric vehicle supply equipment to provide electric vehicle charging stations at such time as it is needed for use by residents? • Multiple-family projects of more than 17 dwelling units: Of the total required listed cabinets, boxes or enclosures, would 50% have the necessary electric vehicle supply equipment installed to provide active electric vehicle charging stations ready for use by residents? • Non-residential projects: Of the total required listed cabinets, boxes or enclosures, would 50% have the necessary electric vehicle supply equipment installed to provide active electric vehicle charging stations ready for use? Check "N/A" only if the project is a single-family project or would not require the provision of listed cabinets, boxes, or enclosures connected to a conduit linking the parking spaces with electrical service, e.g., projects requiring fewer than 10 parking spaces. The project would implement management practice AQ MGMT-22, as described in EIS Section 3.1.5.9: Include at least 50 percent of the total required listed cabinets, boxes, or enclosures with the necessary electric vehicle supply equipment installed to provide active electric vehicle charging stations ready for use. This measure applies to both residential and nonresidential uses.	☑	☐	☐
Strategy 3: Bicycling, Walking, Transit & Land Use (Complete this section if project includes non-residential or mixed uses)			
4. *Bicycle Parking Spaces* Would the project provide more short- and long-term bicycle parking spaces than required in the City's Municipal Code (Chapter 14, Article 2, Division 5)?[6] Check "N/A" only if the project is a residential project. The project would implement management practice AQ MGMT-23, as described in EIS Section 3.1.5.9: Provide more short- and long-term bicycle parking spaces than required in the City's Municipal Code (Chapter 14, Article 2, Division 5) for each nonresidential use.	☑	☐	☐

[6] Non-portable bicycle corrals within 600 feet of project frontage can be counted towards the project's bicycle parking requirements.

5. *Shower facilities*

If the project includes nonresidential development that would accommodate over 10 tenant occupants (employees), would the project include changing/shower facilities in accordance with the voluntary measures under the California Green Building Standards Code as shown in the table below?

Number of Tenant Occupants (Employees)	Shower/Changing Facilities Required	Two-Tier (12" X 15" X 72") Personal Effects Lockers Required
0-10	0	0
11-50	1 shower stall	2
51-100	1 shower stall	3
101-200	1 shower stall	4
Over 200	1 shower stall plus 1 additional shower stall for each 200 additional tenant-occupants	1 two-tier locker plus 1 two-tier locker for each 50 additional tenant-occupants

Check "N/A" only if the project is a residential project, or if it does not include nonresidential development that would accommodate over 10 tenant occupants (employees).

The project would implement management practice AQ MGMT-29, as described in EIS Section 3.1.5.9: Each building that would accommodate over 10 employees would include: (a) 11-50 employees: 1 shower stall and 2 two-tier lockers; (b) 51-100 employees: 1 shower stall and 3 two-tier lockers; (c) 101-200 employees: 1 shower stall and 4 two-tier lockers; and (d) Over 200 employees: 1 shower stall plus 1 additional shower stall for each 200 additional employees, and 1 two-tier locker plus 1 two-tier locker for each 50 additional employees.

☑ ☐ ☐

6. *Designated Parking Spaces*

If the project includes a nonresidential use in a TPA, would the project provide designated parking for a combination of low-emitting, fuel-efficient, and carpool/vanpool vehicles in accordance with the following table?

Number of Required Parking Spaces	Number of Designated Parking Spaces
0-9	0
10-25	2
26-50	4
51-75	6
76-100	9
101-150	11
151-200	18
201 and over	At least 10% of total

This measure does not cover electric vehicles. See Question 4 for electric vehicle parking requirements.

Note: Vehicles bearing Clean Air Vehicle stickers from expired HOV lane programs may be considered eligible for designated parking spaces. The required designated parking spaces are to be provided within the overall minimum parking requirement, not in addition to it.

Check "N/A" only if the project is a residential project, or if it does not include nonresidential use in a TPA.

☑ ☐ ☐

The project would implement management practice AQ MGMT-25, as described in EIS Section 3.1.5.9: Provide designated parking for low-emitting, fuel-efficient, and carpool/vanpool vehicles (electric vehicles excluded) for each nonresidential use: (a) 10-25 required spaces: 2 spaces; (b) 26-50 required spaces: 4 spaces; (c) 51-75 required spaces: 6 spaces; (d) 76-100 required spaces: 9 spaces; (e) 101-150 required spaces: 11 spaces; (f) 151-200 required spaces: 18 spaces; (g) >200 required spaces: At least 10% of total. The number of required parking spaces is set by the San Diego Municipal Code.

7. *Transportation Demand Management Program* If the project would accommodate over 50 tenant-occupants (employees), would it include a transportation demand management program that would be applicable to existing tenants and future tenants that includes: At least one of the following components: • Parking cash out program • Parking management plan that includes charging employees market-rate for single-occupancy vehicle parking and providing reserved, discounted, or free spaces for registered carpools or vanpools • Unbundled parking whereby parking spaces would be leased or sold separately from the rental or purchase fees for the development for the life of the development And at least three of the following components: • Commitment to maintaining an employer network in the SANDAG iCommute program and promoting its RideMatcher service to tenants/employees • On-site carsharing vehicle(s) or bikesharing • Flexible or alternative work hours • Telework program • Transit, carpool, and vanpool subsidies • Pre-tax deduction for transit or vanpool fares and bicycle commute costs • Access to services that reduce the need to drive, such as cafes, commercial stores, banks, post offices, restaurants, gyms, or childcare, either onsite or within 1,320 feet (1/4 mile) of the structure/use? Check "N/A" only if the project is a residential project or if it would not accommodate over 50 tenant-occupants (employees). The project would implement management practice TRANS MGMT-1, as described in EIS Section 3.2.3.9: Implement TDM program to reduce single-occupancy vehicle trips induced by the Proposed Action. TDM involves a set of strategies, programs, services, and physical elements that influence travel behavior by mode, frequency, time, route, or trip length to help achieve more efficient and sustainable transportation facilities. EIS Appendix E, Section 27 provides a full list of TDM strategies for consideration. The strategies are grouped into the following categories: (a) neighborhood / site enhancements; (b) parking policy / pricing; and (c) commute trip reduction programs.	☑	☐	☐

Step 3: Project CAP Conformance Evaluation (if applicable)

The third step of the CAP consistency review only applies if Step 1 is answered in the affirmative under option B. The purpose of this step is to determine whether a project that is located in a TPA but that includes a land use plan and/or zoning designation amendment is nevertheless consistent with the assumptions in the CAP because it would implement CAP Strategy 3 actions. In general, a project that would result in a reduction in density inside a TPA would not be consistent with Strategy 3.The following questions must each be answered in the affirmative and fully explained.

1. **Would the proposed project implement the General Plan's City of Villages strategy in an identified Transit Priority Area (TPA) that will result in an increase in the capacity for transit-supportive residential and/or employment densities?**

   Considerations for this question:
   - Does the proposed land use and zoning designation associated with the project provide capacity for transit-supportive residential densities within the TPA?
   - Is the project site suitable to accommodate mixed-use village development, as defined in the General Plan, within the TPA?
   - Does the land use and zoning associated with the project increase the capacity for transit-supportive employment intensities within the TPA?

2. **Would the proposed project implement the General Plan's Mobility Element in Transit Priority Areas to increase the use of transit?**

   Considerations for this question:
   - Does the proposed project support/incorporate identified transit routes and stops/stations?
   - Does the project include transit priority measures?

3. **Would the proposed project implement pedestrian improvements in Transit Priority Areas to increase walking opportunities?**

   Considerations for this question:
   - Does the proposed project circulation system provide multiple and direct pedestrian connections and accessibility to local activity centers (such as transit stations, schools, shopping centers, and libraries)?
   - Does the proposed project urban design include features for walkability to promote a transit supportive environment?

4. **Would the proposed project implement the City of San Diego's Bicycle Master Plan to increase bicycling opportunities?**

   Considerations for this question:
   - Does the proposed project circulation system include bicycle improvements consistent with the Bicycle Master Plan?
   - Does the overall project circulation system provide a balanced, multimodal, "complete streets" approach to accommodate mobility needs of all users?

5. **Would the proposed project incorporate implementation mechanisms that support Transit Oriented Development?**

   Considerations for this question:
   - Does the proposed project include new or expanded urban public spaces such as plazas, pocket parks, or urban greens in the TPA?
   - Does the land use and zoning associated with the proposed project increase the potential for jobs within the TPA?
   - Do the zoning/implementing regulations associated with the proposed project support the efficient use of parking through mechanisms such as: shared parking, parking districts, unbundled parking, reduced parking, paid or time-limited parking, etc.?

6. **Would the proposed project implement the Urban Forest Management Plan to increase urban tree canopy coverage?**

   Considerations for this question:
   - Does the proposed project provide at least three different species for the primary, secondary and accent trees in order to accommodate varying parkway widths?
   - Does the proposed project include policies or strategies for preserving existing trees?
   - Does the proposed project incorporate tree planting that will contribute to the City's 20% urban canopy tree coverage goal?

Responses to these six questions are attached.

CLIMATE ACTION PLAN CONSISTENCY CHECKLIST
ATTACHMENT A

This attachment provides performance standards for applicable Climate Action Pan (CAP) Consistency Checklist measures.

Table 1 **Roof Design Values for Question 1: Cool/Green Roofs supporting Strategy 1: Energy & Water Efficient Buildings of the Climate Action Plan**

Land Use Type	Roof Slope	Minimum 3-Year Aged Solar Reflectance	Thermal Emittance	Solar Reflective Index
Low-Rise Residential	≤ 2:12	0.55	0.75	64
	> 2:12	0.20	0.75	16
High-Rise Residential Buildings, Hotels and Motels	≤ 2:12	0.55	0.75	64
	> 2:12	0.20	0.75	16
Non-Residential	≤ 2:12	0.55	0.75	64
	> 2:12	0.20	0.75	16

Source: Adapted from the California Green Building Standards Code (CALGreen) Tier 1 residential and non-residential voluntary measures shown in Tables A4.106.5.1 and A5.106.11.2.2, respectively. Roof installation and verification shall occur in accordance with the CALGreen Code.

CALGreen does not include recommended values for low-rise residential buildings with roof slopes of ≤ 2:12 for San Diego's climate zones (7 and 10). Therefore, the values for climate zone 15 that covers Imperial County are adapted here.

Solar Reflectance Index (SRI) equal to or greater than the values specified in this table may be used as an alternative to compliance with the aged solar reflectance values and thermal emittance.

Table 2	**Fixture Flow Rates for Non-Residential Buildings related to Question 2: Plumbing Fixtures and Fittings supporting Strategy 1: Energy & Water Efficient Buildings of the Climate Action Plan**
Fixture Type	**Maximum Flow Rate**
Showerheads	1.8 gpm @ 80 psi
Lavatory Faucets	0.35 gpm @60 psi
Kitchen Faucets	1.6 gpm @ 60 psi
Wash Fountains	1.6 [rim space(in.)/20 gpm @ 60 psi]
Metering Faucets	0.18 gallons/cycle
Metering Faucets for Wash Fountains	0.18 [rim space(in.)/20 gpm @ 60 psi]
Gravity Tank-type Water Closets	1.12 gallons/flush
Flushometer Tank Water Closets	1.12 gallons/flush
Flushometer Valve Water Closets	1.12 gallons/flush
Electromechanical Hydraulic Water Closets	1.12 gallons/flush
Urinals	0.5 gallons/flush

Source: Adapted from the California Green Building Standards Code (CALGreen) Tier 1 non-residential voluntary measures shown in Tables A5.303.2.3.1 and A5.106.11.2.2, respectively. See the California Plumbing Code for definitions of each fixture type.

Where complying faucets are unavailable, aerators rated at 0.35 gpm or other means may be used to achieve reduction.

Acronyms:
gpm = gallons per minute
psi = pounds per square inch (unit of pressure)
in. = inch

Table 3	Standards for Appliances and Fixtures for Commercial Application related to Question 2: Plumbing Fixtures and Fittings supporting Strategy 1: Energy & Water Efficient Buildings of the Climate Action Plan	
Appliance/Fixture Type	**Standard**	
Clothes Washers	Maximum Water Factor (WF) that will reduce the use of water by 10 percent below the California Energy Commissions' WF standards for commercial clothes washers located in Title 20 of the *California Code of Regulations.*	
Conveyor-type Dishwashers	0.70 maximum gallons per rack (2.6 L) (High-Temperature)	0.62 maximum gallons per rack (4.4 L) (Chemical)
Door-type Dishwashers	0.95 maximum gallons per rack (3.6 L) (High-Temperature)	1.16 maximum gallons per rack (2.6 L) (Chemical)
Undercounter-type Dishwashers	0.90 maximum gallons per rack (3.4 L) (High-Temperature)	0.98 maximum gallons per rack (3.7 L) (Chemical)
Combination Ovens	Consume no more than 10 gallons per hour (38 L/h) in the full operational mode.	
Commercial Pre-rinse Spray Valves (manufactured on or after January 1, 2006)	Function at equal to or less than 1.6 gallons per minute (0.10 L/s) at 60 psi (414 kPa) and • Be capable of cleaning 60 plates in an average time of not more than 30 seconds per plate. • Be equipped with an integral automatic shutoff. • Operate at static pressure of at least 30 psi (207 kPa) when designed for a flow rate of 1.3 gallons per minute (0.08 L/s) or less.	

Source: Adapted from the California Green Building Standards Code (CALGreen) Tier 1 non-residential voluntary measures shown in Section A5.303.3. See the California Plumbing Code for definitions of each appliance/fixture type.

Acronyms:
L = liter
L/h = liters per hour
L/s = liters per second
psi = pounds per square inch (unit of pressure)
kPa = kilopascal (unit of pressure)

Responses to Step 3: Project CAP Conformance Evaluation

(Responses were obtained from EIS Appendix A, Section 2.1.1.3, Impact GHG-2)

1. Would the proposed project implement the General Plan's City of Villages strategy in an identified TPA that will result in an increase in the capacity for transit-supportive residential and/or employment densities?

Yes. The City defines a "village" as the mixed-use heart of a community where residential, commercial, employment, and civic uses are all present and integrated. The City of Villages strategy focuses growth into mixed-use activity centers that are pedestrian-friendly districts linked to an improved regional transit system. The strategy is designed to sustain the long-term economic, environmental, and social health of the City and its many communities.

OTC Site 1 is the primary land area within the Kurtz District, which the Community Plan has planned as an employment area with military, office, research and development, and complementary residential uses to support and complement the NAVWAR functions. OTC Site 2 is within the Dutch Flats Urban Village, which is planned as an employment and residential-focused urban village. Under existing conditions, all but the easternmost portions of the Kurtz District and Dutch Flats Village are within a TPA (the exception being the area roughly east of Enterprise Street, including the southeast portion of OTC Site 1). By relocating the Old Town Transit Center to OTC Site 1, The proposed project would extend the TPA to cover the currently excluded portions of the Kurtz District and Dutch Flats Village.

The proposed project would provide a transit-oriented mixed-use, high-density development within the Kurtz District and Dutch Flats Urban Village. The development would include transit-supportive residential, hotel, and employment uses close to the relocated transit center. Specifically, the project would construct 10,000 new residential units, 450 new hotel rooms, 1.6 million square feet of new private office and retail space, and 1.1 million square feet of government office, laboratory, and warehouse space within 0.5 mile of the relocated transit center. The traffic study estimated that the mixed-use benefit of the proposed project would result in 6,663 avoided daily trips.

2. Would the proposed project implement the General Plan's Mobility Element in TPAs to increase the use of transit?

Yes. The General Plan's Mobility Element promotes the City of Villages strategy by calling for villages, employment centers, and other higher-intensity uses to be located in areas that can be served by high quality transit services. The proposed project would feature a transit center that provides access to Amtrak, the Coaster, the Trolley, and numerous MTS bus lines. All development would be within 0.5 miles of the relocated transit center. Management practice AQ MGMT-30 would design transit stops to provide convenient access to future residents and workers. AQ MGMT-26 would encourage new multifamily residential uses to provide discounted transit passes to residents. TRANS-MGMT-1 would implement a TDM program to increase the use of transit. Furthermore, the project transportation study recommended an evaluation of the feasibility of providing transit signal priority along four roadway segments near OTC. The transportation study also recommended preparation of a transit mobility plan for the proposed project to maximize the efficiency and attractiveness of transit for future employees and residents.

3. Would the proposed project implement pedestrian improvements in TPAs to increase walking opportunities?

Yes. The proposed project would implement management practice AQ MGMT-27, which would design the project to include a complete, functional, and interconnected pedestrian network. Because project-level planning details are unknown at this time, the specific pedestrian amenities have not been finalized. However, the project transportation study recommended 14 improvements within ½ mile walking distance from the OTC to enhance pedestrian accessibility to adjacent communities. The transportation study also recommended preparation of a pedestrian master plan for the proposed project to guide design and implementation of policies and programs to enhance access and mobility around and within the site for pedestrians of all ages and abilities.

4. Would the proposed project implement the City of San Diego's Bicycle Master Plan to increase bicycling opportunities?

Yes. The goals of the *City of San Diego Bicycle Master Plan* are to (1) make bicycling a viable travel choice, particularly for trips of less than five miles; (2) provide a safe and comprehensive local and regional bikeway network; and (3) produce environmental quality, public health, recreation, and mobility benefits through increased bicycling. The proposed project would implement management practice AQ MGMT-24, which would design the project to include dedicated bicycle lanes that connect to other communities and to the regional bicycle network. Because project-level planning details are unknown at this time, the specific bicycle amenities have not been finalized. However, the transportation study recommended 12 improvements within ½ mile bicycling distance from the OTC to enhance offsite bicycle network connectivity and improve safety. The transportation study also recommended preparation of a bicycle master plan for the proposed project to guide design and implementation of policies and programs to enhance access and mobility around and within the site for bicyclists of all ages and abilities.

5. Would the proposed project incorporate implementation mechanisms that support transit-oriented development?

Yes. The proposed project would construct 10,000 new residential units, 450 new hotel rooms, 1.6 million square feet of new private office and retail space, 1.1 million square feet of government office, laboratory, and warehouse space, and 18 acres of parkland, all within a TPA that is served by the San Diego Trolley, Amtrak, Coaster, and numerous bus lines. As described above in the responses to Questions 1 through 4, The proposed project would include transit, bicycle, and pedestrian improvements to encourage alternative modes of transportation. Management practice TRANS MGMT-1 would implement a TDM program to increase the use of transit.

6. Would the proposed project implement the Urban Forest Management Plan to increase urban tree canopy coverage?

Yes. One of the primary goals of the City's *Urban Forestry Program* is to increase the City's urban tree canopy cover and maximize the benefits of trees. The CAP set targets of 15 percent urban tree canopy coverage by 2020 and 35 percent by 2035. The proposed project would support the City's goals by planting trees throughout its development. Major streets and pathways within the project site would include trees and other natural amenities to provide shade and create a more inviting pedestrian environment. At this time, it is unknown if the proposed project would satisfy the specific CAP targets for tree canopy coverage. However, management practice AQ MGMT-11 would incorporate sustainable landscapes into the project design, including tree planting, use of drought-tolerant native vegetation, and use of high efficiency irrigation technology.

Appendix B
Relevant Laws and Regulations

This page intentionally left blank.

Table B-1 Summary of Relevant Laws and Regulations

Relevant Law or Regulation	*Description*
National Environmental Policy Act (42 U.S.C. sections 4321–4370h)	NEPA is our basic national charter for protection of the environment. It establishes policy, sets goals (section 101), and provides means (section 102) for carrying out the policy. Section 102(2) contains "action-forcing" provisions to make sure that federal agencies act according to the letter and spirit of the Act, including, requirements for environmental analysis of federal actions that have the potential to significantly impact the quality of the human environment.
CEQ Regulations for Implementing the Procedural Provisions of NEPA (40 CFR parts 1500–1508)	Ensure the implementation of section 102(2) of NEPA. The purpose is to tell federal agencies what they must do to comply with the procedures and achieve the goals of NEPA. The regulations contain procedures to make the NEPA process timely, concise, and useful to decision makers and the public, and to integrate the requirements of NEPA with other planning and environmental review procedures required by law or agency, in order to restore, enhance or minimize impacts to the human environment.
Navy regulations for implementing NEPA (32 CFR part 775)	Ensure the implementation of the procedural provisions of NEPA and the DoD Instruction on Environmental Planning and Analysis and assign responsibilities within the DON for preparation, review and approval of environmental documents prepared under NEPA.
Clean Air Act (42 U.S.C. section 7401 et seq.)	The comprehensive federal law regulating air emissions from stationary and mobile sources. Among other things, this law authorizes USEPA to establish National Ambient Air Quality Standards (NAAQS) to protect public health and public welfare and to regulate emissions of hazardous air pollutants. General conformity is a process required by the Act, established to ensure that actions conducted or sponsored by federal agencies are consistent with air quality goals set by each state to meet the NAAQS. To attain or maintain the NAAQS, each state develops a State Implementation Plan, which includes the strategy and modeling that demonstrates attainment or maintenance, and the various rules, regulations, and programs that provide the necessary air pollutant emissions reductions.
Clean Water Act (33 U.S.C. section 1251 et seq.)	Establishes the basic structure for regulating discharges of pollutants into the waters of the U.S. and regulating quality standards for surface waters. The Act makes it unlawful to discharge any pollutant from a point source into navigable waters unless a permit was obtained. Under this Act, the USEPA has implemented pollution control programs such as the National Pollutant Discharge Elimination System permit program, which controls discharges of wastewater and pollutants to surface waters.
Rivers and Harbors Act (33 U.S.C. section 407)	Requires authorization from the Secretary of the Army, acting through the Corps of Engineers, for the construction of any structure in or over any navigable water of the U.S. The law applies to any structure or work that affects the course, location, or condition of the water body and includes any dredging or disposal of dredged materials, excavation, filling, re-channelization, or any other modification of a navigable water of the U.S. and applies to all structures, from the smallest floating dock to the largest commercial undertaking.
Coastal Zone Management Act (16 U.S.C. section 1451 et seq.)	Provides for the management of the nation's coastal resources, including the Great Lakes and aims to balance competing land and water issues through state and territorial coastal management programs. The Act outlines three national programs, the National Coastal Zone Management Program, the National Estuarine Research Reserve System, and the Coastal and Estuarine Land Conservation Program. The Act is administered by Administered by the National Oceanic and Atmospheric Administration.
Section 438 of the Energy Independence and Security Act	Requires federal agencies to develop facilities having a footprint that exceeds 5,000 square feet in a manner that maintains or restores the pre-development site hydrology to the maximum extent technically feasible. Agencies can meet the pre-development hydrology requirements in two ways: (1) managing on-site the total volume of rainfall from the 95th percentile storm, or (2) managing on-site the total volume of rainfall based on a site-specific hydrologic analysis through various engineering techniques.

Relevant Law or Regulation	*Description*
National Historic Preservation Act (54 U.S.C. section 306108 et seq.)	Requires federal agencies to consider the impact of their actions on historic properties and provide the Advisory Committee on Historic Preservation with an opportunity to comment on projects before implementation. The NHPA requires that agencies assume responsibility for the consequences of their actions on historic properties, are publicly accountable for their decisions, and establish preservation programs.
Endangered Species Act (16 U.S.C. section 1531 et seq.)	Goal of the Act is to conserve the ecosystems upon which threatened and endangered species depend and to conserve and recover listed species. Section 7 of this Act requires action proponents to consult with the USFWS to ensure their actions are not likely to jeopardize the continued existence of federally listed threatened and endangered species or result in the destruction or adverse modification of designated critical habitat.
Migratory Bird Treaty Act (16 U.S.C. section 703–712)	Birds, both migratory and most native-resident bird species, are protected under this Act, and it is unlawful by any means or in any manner, to pursue, hunt, take, capture, kill; attempt to take, capture, or kill; or possess migratory birds or their nests or eggs at any time, unless permitted by regulation.
Comprehensive Environmental Response and Liability Act (42 U.S.C. section 9601 et seq.)	Provides a federal "Superfund" to clean up uncontrolled or abandoned hazardous waste sites as well as accidents, spills, and other emergency releases of pollutants and contaminants into the environment. USEPA was given power through this Act to seek out those parties responsible for any release and assure their cooperation in the cleanup in all 50 states and U.S. territories. Superfund site identification, monitoring, and response activities in states are coordinated through the state environmental protection or waste management agencies.
Emergency Planning and Community Right-to-Know Act (42 U.S.C. sections 11001–11050)	Requires each state to appoint a State Emergency Response Commission that divides their states into Emergency Planning Districts and names a Local Emergency Planning Committee for each district comprised of representatives from all elements of the planning process. Enacted to help local communities protect public health, safety, and the environment from chemical hazards, and authorized by Title III of the Superfund Amendments and Reauthorization Act.
Resource Conservation and Recovery Act (42 U.S.C. section 6901 et seq.)	Gives the USEPA the authority to control the generation, transportation, treatment, storage, and disposal of hazardous waste. RCRA also set forth a framework for the management of non-hazardous solid wastes and enables the USEPA to address environmental problems that could result from underground tanks storing petroleum and other hazardous substances.
Toxic Substances Control Act (15 U.S.C. sections 2601–2629)	Gives the USEPA the authority to require reporting, record-keeping, testing requirements, and restrictions relating to the production, importation, use, and disposal of specific chemicals including PCBs, asbestos, radon, and lead-based paint.
Sikes Act	Requires the DoD to develop and implement Integrated Natural Resources Management Plans for military installations across the U.S., ensuring ecosystems on military bases are protected and enhanced while allowing the military lands to continue to meet the needs of military operations. The Plans are prepared in cooperation with the USFWS and State fish and wildlife agencies to ensure proper consideration of fish, wildlife, and habitat needs.
Noise Control Act of 1972	Established workplace standards for noise. If noise levels exceed standards, employers are required to provide hearing protection equipment that will reduce sound levels to acceptable limits. The Act is administered by the Occupational Safety and Health Administration.
EO 11988, Floodplain Management	Requires federal agencies to avoid to the extent possible the long and short-term adverse impacts associated with the occupancy and modification of flood plains and to avoid direct and indirect support of floodplain development wherever there is a practicable alternative.

Relevant Law or Regulation	*Description*
EO 12088, Federal Compliance with Pollution Control Standards	Requires that the head of each Executive agency is responsible for ensuring all necessary actions are taken for the prevention, control, and abatement of environmental pollution with respect to federal facilities and activities under the control of the agency.
EO 12898, Federal Actions to Address Environmental Justice in Minority Populations and Low-income Populations	Directs federal agencies to identify and address the disproportionately high and adverse human health or environmental effects of their actions on minority and low-income populations, to the greatest extent practicable and permitted by law. Also directs each agency to develop a strategy for implementing environmental justice. The purpose of this EO is to focus federal attention on the environmental and human health effects of federal actions on minority and low-income populations with the goal of achieving environmental protection for all communities.
EO 13045, Protection of Children from Environmental Health Risks and Safety Risks	Requires each federal agency make it a high priority to identify and assess environmental health risks and safety risks that may disproportionately affect children and ensure its policies, programs, activities, and standards address disproportionate risks to children that result from environmental health risks or safety risks.
EO 13186, Responsibilities of Federal Agencies to Protect Migratory Birds	Directs federal agencies that take actions that either directly or indirectly effect migratory birds, to develop a Memorandum of Understanding and to work with the USFWS and other federal agencies to promote the conservation of migratory bird populations.
EO 13423, Strengthening Federal Environmental, Energy, and Transportation Management	Directs federal agencies to conduct their environmental, transportation, and energy-related activities under the law in support of their respective missions in an environmentally, economically and fiscally sound, integrated, continuously improving, efficient, and sustainable manner.
EO 13175, Consultation and Coordination with Indian Tribal Governments	Applies to rules, policies, and guidance having substantial direct effects on one or more Indian tribes, on the relationship between the federal government and Indian tribes, or on the distribution of power and responsibilities between the federal government and Indian tribes. The agency may not promulgate rules that cause substantial direct compliance costs on Indian tribal governments, and are not required by statute, or that preempt tribal law, unless they provide funds necessary to pay direct compliance costs of the tribal governments or consult with tribal officials early in the process before promulgation and make available to the Office of Management and Budget any written communications from tribal officials.
EO 13990, Protecting Public Health and the Environment and Restoring Science to Tackle the Climate Crisis,	Directs the heads of agencies to immediately review agency actions taken between January 20, 2017, and January 20, 2021 that conflict with important national objectives, and to immediately commence work to confront the climate crisis. The EO revokes a number of EOs, including EO 13834 of May 17, 2018 (Efficient Federal Operations), except for sections 6, 7, and 11. Directs the CEQ to rescind its draft guidance entitled, "Draft National Environmental Policy Act Guidance on Consideration of Greenhouse Gas Emissions," 84 Fed. Reg. 30097 (June 26, 2019), and as appropriate and consistent with applicable law, to review, revise, and update its final guidance entitled, "Final Guidance for Federal Departments and Agencies on Consideration of Greenhouse Gas Emissions and the Effects of Climate Change in National Environmental Policy Act Reviews," 81 Fed. Reg. 51866 (August 5, 2016).
EO 13693, Planning for Federal Sustainability in the Next Decade	Requires federal agencies to achieve: Greenhouse Gas Emissions Reduction and Reporting; Energy Conservation and Renewable Energy; Green Building Performance; Water and Stormwater Management; Fleet Performance; Employee Commuting and Workplace Travel; Facility Resiliency; Sustainable Acquisition; Solid Waste Diversion and Pollution Prevention; Performance Contracting; Electronics Stewardship; and a Strategic Sustainability Performance Plan.

Relevant Law or Regulation	*Description*
EO 14008, Tackling the Climate Crisis at Home and Abroad	EO 14008 amends EO 12898 to create, within the Executive Office of the President, a White House Environmental Justice Interagency Council (Interagency Council) and calls for the Interagency Council to provide recommendations for further updating EO 12898.
OPNAVINST 11010.36C and MCO 11010.16, Air Installations Compatible Use Zone Program	Promotes compatible development near military airfields in order to protect the health, safety, and welfare of people living near the airfield, while preserving the defense flying mission. The Program recommends incorporation of noise contours, accident potential zones, and other safety criteria, into the local land use planning process and provides recommendations for development that is compatible with the air station's mission.

Legend: CEQ = Council on Environmental Quality; CFR = Code of Federal Regulations; DoD = Department of Defense; DON = Department of the Navy; EO = Executive Order; MCO= Marine Corps Order; NEPA = National Environmental Policy Act; NHPA = National Historic Preservation Act; OPNAVINST = Chief of Naval Operations Instruction; PCBs = polychlorinated biphenyls; RCRA = Resource Conservation and Recovery Act; U.S. = United States; U.S.C. = U.S. Code; USEPA = U.S. Environmental Protection Agency; USFWS = U.S. Fish and Wildlife Service.

Table B-2 Summary of Relevant California State Laws and Regulations

Relevant Law or Regulation	*Description*
Alquist-Priolo Earthquake Fault Zoning Act (California Public Resource Code section 2621-2630 1972 amended 1994)	Addresses surface-fault rupture hazard by prohibiting most structures for human occupancy from being placed over the trace of an active fault. The Act established the State Mining and Geology Board and is responsible for the California Geological Survey and fault maps. The State Mining and Geology Board establishes specific regulations to guide lead agencies in implementing the law.
California Building Standards Code (Title 24, California Code of Regulations)	All occupancies in California are subject to national model codes adopted into Title 24, and occupancies are further subject to amendments adopted by state agencies and ordinances implemented by local jurisdictions' governing bodies.
The Seismic Hazards Mapping Act of 1990 (Public Resources Code, Chapter 7.8, section 2690-2699.6)	Directs the Department of Conservation, California Geological Survey to identify and map areas prone to earthquake hazards of liquefaction, earthquake-induced landslides, and amplified ground shaking. Requires the State Geologist to establish regulatory zones and to issue appropriate maps to all affected cities, counties, and state agencies for their use in planning and controlling construction and development.
Porter-Cologne Water Quality Control Act	Requires a person who discharges waste into the waters of the state in violation of waste discharge requirements or other order or prohibition issued by a California regional water quality control board or the State Water Resources Control Board to clean up the waste or to abate the effects of the waste. Authorizes the regional board to expend available moneys to perform any cleanup, abatement, or remedial work required under those circumstances.
California Water Code	Regulates and authorizes water use in the State so that the water resources of the State be put to beneficial use to the fullest extent of which they are capable, and that the waste or unreasonable use or unreasonable method of use of water be prevented, and that the conservation of such water is to be exercised with a view to the reasonable and beneficial use thereof in the interest of the people and for the public welfare.

Relevant Law or Regulation	***Description***
California Accidental Release Prevention Law	The Law establishes the California Accidental Release Program, with the goal of preventing accidental releases of substances that can cause serious harm to the public and the environment, to minimize the damage if releases do occur, and to satisfy community right-to-know laws. Requires businesses that handle more than a threshold quantity of a regulated substance listed in the regulations to develop a Risk Management Plan, which is a detailed engineering analysis of the potential accident factors present at a business and the mitigation measures that can be implemented to reduce this accident potential.
California Occupational Safety and Health Act	Protects and improves the health and safety of workers in California and the safety of passengers riding on elevators, amusement rides, and tramways. Enforces effective standards, assists, and encourages employers to maintain safe and healthful working conditions, and provides for enforcement, research, information, education, and training in the field of occupational safety and health.
Hazardous Materials Handling and Emergency Response “Waters Bill”	Requires local governments to regulate local businesses' storage of hazardous materials and to be prepared to respond to the possible release of such materials. Handlers of hazardous materials are required to develop and submit a hazardous materials "Business Plan" to local administering agencies, and to report actual and threatened releases of hazardous materials to their local agency and to the state-level Governor's Office of Emergency Services.
California Health and Safety Code, Division 20, Chapter 6.5, Hazardous Waste Control Law	Includes codes and statutes related to the testing, treatment, storage, and disposal of hazardous wastes.
Carpenter-Presley-Tanner Hazardous Substance Account Act “State Superfund”	Establishes an extensive and complex series of programs authorizing public agencies to order owners of contaminated property, including "brownfields" to conduct cleanups of the properties. The Act is administered by the State’s Department of Toxic Substances Control.
Hazardous Substances Act (California PRC sections 108100-108515)	Requires manufacturers or importers to classify the hazards of chemicals which they produce or import, and all employers to provide information to their employees about the hazardous chemicals to which they may be exposed, by means of a hazard communication program, labels and other forms of warning, safety data sheets, and information and training. In addition, this section requires distributors to transmit the required information to employers.
California Air Quality Laws	Establishes the California Ambient Air Quality Standards, which are often more stringent than national standards. Ambient air quality standards define ‘clean air’ by setting the maximum amount of a pollutant averaged over a specified period of time that can be present in outdoor air without any harmful effects on people or the environment. The standards are established to protect the health of the most sensitive groups in California.
California Health and Safety Code Section 41700	(a) Except as otherwise provided in Section 41705 , a person shall not discharge from any source whatsoever quantities of air contaminants or other material that cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or that endanger the comfort, repose, health, or safety of any of those persons or the public, or that cause, or have a natural tendency to cause, injury or damage to business or property. (b) This section shall become operative on January 1, 2014.
In-Use Off-Road Diesel-Fueled Fleets Regulation	CARB regulation: The In-Use Off-Road Diesel-Fueled Fleets Regulation (Off-Road Regulation) applies to all self-propelled off-road diesel vehicles 25 horsepower or greater used in California and most two-engine vehicles (except on-road two-engine sweepers). This includes vehicles that are rented or leased (rental or leased fleets).

Relevant Law or Regulation	*Description*
Toxic Air Contaminant Identification and Control Act (AB 1807, Tanner 1983)	Created California's program to reduce exposure to air toxics. The program involves a two-step process: (1) risk identification, and (2) risk management.
Air Toxics "Hot Spots" Information and Assessment Act (AB 2588, 1987, Connelly)	Requires stationary sources to report the types and quantities of certain substances routinely released into the air.
Airborne Toxic Control Measure to Limit Diesel-Fueled Commercial Motor Vehicle Idling (13 CCR section 2485)	Requires, among other things, that drivers of diesel-fueled commercial motor vehicles with gross vehicle weight ratings greater than 10,000 pounds, including buses and sleeper berth equipped trucks, not idle the vehicle's primary diesel engine longer than five minutes at any location.
Building Energy Efficiency Standards - Title 24	California's energy code is designed to reduce wasteful and unnecessary energy consumption in newly constructed and existing buildings. The California Energy Commission updates the Building Energy Efficiency Standards (Title 24, Parts 6 and 11) every three years by working with stakeholders in a public and transparent process.
Green Building Standards (24 CCR, part 11)	The California Green Building Standards Code, known as CALGreen, is the first-in-the-nation mandatory green building standards code, developed in order to meet the goals of California's landmark initiative AB 32, which established a comprehensive program of cost-effective reductions of GHG to 1990 levels by 2020. The California Building Standards Commission has the authority to propose CALGreen standards for nonresidential structures that include, but are not limited to, new buildings or portions of new buildings, additions and alterations, and all occupancies where no other state agency has the authority to adopt green building standards applicable to those occupancies.
Aboveground Petroleum Storage Act	Regulates non-transportation related facilities with aggregate aboveground petroleum storage capacities of 1,320 gallons or more stored in aboveground storage containers, tanks, oil-filled equipment, or tank in an underground area with petroleum storage capacities of 55 gallons or greater. The California Department of Forestry and Fire Protection Office of the State Fire Marshal has oversight responsibility of the Act.
Underground Storage Tank Law	Protects public health and safety, and the environment from releases of petroleum and other hazardous substances from underground storage tanks through four program elements: Leak Prevention, Cleanup, Enforcement, Tank Tester Licensing. The Law is administered by the California State Water Resources Board.
Solid Waste (Title 27, Environmental Protection, California Code of Regulations, Division 2)	Regulations of CalRecycle and the State Water Resources Control Board pertaining to waste disposal on land, including provisions for the minimization of landfill disposal and recycling and reuse programs.

Legend: AB = Assembly Bill; CARB = California Air Resources Board; CCR = California Code of Regulations; GHG = greenhouse gases; PRC = Public Resources Code.

Table B-3 Department of Defense Polices and Guidance

Relevant Law or Regulation	*Description*
2010 Navy Energy Vision	In this document the Secretary of the Navy set goals to improve energy security, increase energy independence, and reduce the reliance on petroleum by increasing energy efficiency and the use of alternative energy.
SECNAVINST 4101.3A (19 JAN 2017)	Department of Defense Navy Energy Program. Purpose is to establish and implement policy, and to assign responsibility within the DON for the administration and management of the DON energy program.
DoD Instruction 4170.11 (31 AUG 2018)	Installation Energy Management Program. Implements policy established in DoD Instruction 4140.25 (Reference (f)) and provides guidance, assigns responsibilities, and prescribes procedures for DoD installation energy management.
DoD Directive 4715.21 (31 AUG 2018)	Climate Change Adaptation and Resilience. Purpose: In accordance with the direction in Executive Order 13653, this issuance establishes policy and assigns responsibilities to provide the DoD with the resources necessary to assess and manage risks associated with the impacts of climate change. This involves deliberate preparation, close cooperation, and coordinated planning by the DoD to: • Facilitate federal, State, local, tribal, private sector, and nonprofit sector efforts to improve climate preparedness and resilience, and to implement the 2014 DoD Climate Change Adaptation Roadmap. • Help safeguard U.S. economy, infrastructure, environment, and natural resources. • • Provide for the continuity of DoD operations, services, and programs.

1 Alternatives Development Approach

This alternatives development memorandum was prepared to define the development potential on the Old Town Campus (OTC) for a range of alternatives. The revitalization of OTC may be accomplished through Navy recapitalization or a number of public-private development scenarios. As such, no specific site plan has been designed for the OTC. In an effort to facilitate analysis of potential environmental impacts in the Environmental Impact Statement (EIS), a maximum threshold was developed for five different alternatives. This approach is a conservative analysis and should not be considered an exact representation of future development. The final development of the OTC site is subject to many variables outside of the Navy's or a private partner's control, including future market conditions, changes to regulations and other factors. The alternatives were developed using the best available information and are meant to represent an envelope approach to both maximum development and a range of lower intensity development to meet the Naval Information Warfare Systems Command (NAVWAR) purpose and need. Currently OTC is Federal property and is not subject to local zoning or development guidelines. Future revitalization of OTC anticipates the property will remain in Federal ownership and the types and intensities of mixed use development proposed for analysis in the EIS would be allowable under existing law.

2 Alternatives

In addition to the no action alternative, five action alternatives were developed for analysis in the EIS. These include revitalization through Navy capital improvements only, two scenarios of mixed use public-private development, and two scenarios of mixed use public-private development including consideration of a potential transit center. The alternatives are defined as follows:

Alternative 1: NAVWAR-Only Redevelopment

This alternative would consist of modernizing OTC to meet NAVWAR's facility requirements with Navy-funded capital improvements only. This would potentially include consolidating NAVWAR operations into two of the existing buildings on OTC Site 1. The Old Town Campus Recapitalization Plan prepared by Makers Architecture provides additional detail (working draft, 15 January 2020).

Alternative 2: Public-Private Redevelopment–NAVWAR and Higher Density Mixed Use

This alternative would consist of construction of new Navy facilities for NAVWAR and mixed use development (e.g., residential, commercial, hotel) on OTC through a public-private development agreement, and the relocation of some warehouse functions to a separate off-site location.

Alternative 3: Public-Private Redevelopment–NAVWAR and Lower Density Mixed Use

This alternative would be similar to Alternative 2, but the development scenario for private development would be reduced. The development requirements for NAVWAR would be the same as Alternative 2.

Alternative 4: Public-Private Redevelopment–NAVWAR and Higher Density Mixed Use with a Transit Center

This alternative would be similar to Alternative 2, but the intensity of mixed use development would be increased and a portion of the OTC site would be developed as a transit center. The development requirements for NAVWAR would be the same as Alternative 2.

Alternative 5: Public-Private Redevelopment–NAVWAR and Lower Density Mixed Use with a Transit Center

This alternative would be similar to Alternative 4, but the intensity of mixed use development would be reduced. The development requirements for NAVWAR would be the same as Alternative 2.

3 Limitations / Risks

The major limitations and risks associated with the alternatives development approach utilized can be summarized into a few topics: City of San Diego development review process, Federal Aviation Administration (FAA) / San Diego International Airport (SDIA) review, and programmatic alternatives as described in this section.

3.1 City of San Diego Development Review Process

It is currently unclear if the City of San Diego development review process would apply to the public-private development alternatives (Alternatives 2 through 5). There has been some discussion that the City's process and associated requirements may not apply due to the federal ownership status of the property. The EIS team sees this as more of a limitation associated with the alternatives development process in that there is not clarity on the topic. We believe the risk is relatively low since the City requirements (parking ratios / parkland requirements) are likely more stringent than an alternative process. Since the public-private development alternatives have been developed based on City requirements, they are by default conservative in nature.

3.2 FAA / SDIA Review

Alternative 2 may be the only alternative that could be constructed under the 166-foot above mean sea level threshold for notifying the FAA and submitting the project for review with 14 Code of Federal Regulations Part 77 Imaginary Surfaces and Hazard Assessment. While all the Alternatives have the potential to be constructed under the Part 77 Imaginary Surfaces, they all could be determined to be an obstacle or hazard to smaller general aviation flights departing SDIA that break to the north. Preliminary coordination with SDIA representatives suggests that FAA's main concern is airport efficiency. If FAA determines one or more buildings constructed as part of the OTC project is an obstacle / hazard and requires SDIA to modify the current timing of the north break for departing general aviation flights, SDIA would probably formally oppose the OTC project as changes to the general aviation timing would negatively affect SDIA's overall efficiency and capacity. This potential scenario can be minimized by site layouts that avoid the tallest buildings in the northeastern portion of Site 2.

3.3 Programmatic Alternatives

The inherent programmatic nature of the Alternatives adds a degree of risk to the assessment of impacts associated with each. While the EIS team is using conservative assumptions, applying industry standards, and using professional judgement, there is no guarantee that actual public-private development proposals submitted will be fully covered by the analysis contained within the EIS.

4 Information Sources

To develop the alternatives, several sources of information were utilized to define Navy requirements and Private Development requirements.

4.1 NAVWAR Requirements

The identification of NAVWAR requirements was required for all alternatives. There are two types of development scenario for NAVWAR: Alternative 1, Navy-only development and Alternatives 2 through 5 that include Navy development and mused use public-private development. The Navy-only requirements were taken from the 15 October 2019 Requirements Package provided by NAVWAR as it documents the full requirements for NAVWAR, Naval Information Warfare Center Pacific (NIWC PAC), and Navy Regional Plant Equipment Office (NRPEO) functions currently being conducted at OTC as shown in Table 4.1-1 under 'NAVWAR Recapitalization'.

The Navy requirements associated with the public-private development alternatives (Alternatives 2 through 5) were taken from the 15 November 2019 and 3 February 2020 Requirements Packages provided by NAVWAR. This set of requirements identifies several Navy functions to be relocated from OTC to other locations within the San Diego region to reduce the Navy footprint required for development at OTC. The on-site and off-site requirements are shown in Table 4.1-1. In addition to identifying various functions for relocation to other locations in the region, NAVWAR also reduced their on-site requirements for NAVWAR headquarters (HQ) and NIWC PAC by shifting some expected growth (5.3 percent [%] to 2% for HQ and 2% to 1% for NIWC PAC) in contractor support to the proposed commercial office development as part of the public-private development project, as shown in Table 4.1-1.

Table 4.1-1 Summary of Navy Requirements

Navy Development	*NAVWAR Recapitalization*[1]	*NAVWAR Revitalization (On-site)*	*NAVWAR Revitalization (Off-site)*	*NAVWAR Commercial Demand (Near OTC)*
Office	1,019,364 SF	845,326 SF	3,900 SF	131,464 SF
Laboratory	174,865 SF	165,614 SF	9,251 SF	
Auditorium	12,000 SF	15,000 SF		
Conference Rooms	14,156 SF	14,156 SF		
Warehouse	481,941 SF	24,172 SF	457,769 SF	
Open Storage	174,267 SF		174,267 SF	
Parking	4,541 stalls	2,000 stalls		2,358 stalls

Legend: SF = square feet.
Notes: (1) Requirements under Alternative 1.
(2) Requirements under Alternatives 2 through 5.
Source: Requirements packages from October 2019, November 2019, and February 2020.

To more fully evaluate the potential commercial office space demand associated with NAVWAR contractors a range of growth rates were evaluated, starting with the 2% and 5.3% stated in the 15 November 2019 Requirements Package Attachment A, and adding 7% and 9% rates to capture the upper ranges of potential growth. Table 4.1-2 shows the effects of these rates on the NAVWAR HQ population only from 2019 to 2024 (matches the Requirements Package timeframe) and then from 2025 to 2030. The table shows the potential shortfall of personnel on-site in 2024 (set at 3,083 in the Requirements

Package) for the various growth rates and then converts that to commercial office space requirements at 185 square feet (SF) per worker established within the London Moeder Advisors (LMA) reports, as discussed in more detail in Section 4.3. In 2024, the shortfall could be between 98,000 SF and 225,000 SF. In 2030, the shortfall could be between 72,000 SF and 763,000 SF. To alleviate these shortfalls, the EIS team targeted 250,000 SF as the amount to add to all commercial office space targets.

Table 4.1-2 Summary of Potential Navy Contractor Support Growth

	2% Growth	*5.3% Growth*	*7% Growth*	*9% Growth*
2019 HQ Population	**2,792**	**2,792**	**2,792**	**2,792**
2020 Estimated Population	2,848	2,940	2,987	3,043
2021 Estimated Population	2,905	3,096	3,197	3,317
2022 Estimated Population	2,963	3,260	3,420	3,616
2023 Estimated Population	3,022	3,433	3,660	3,941
2024 Estimated Population	3,083	3,615	3,916	4,296
On-site Personnel Shortfall	**ND**	**532**	**833**	**1,213**
Commercial SF	ND	98,417 SF	154,166 SF	224,450 SF
2025 Estimated Population	3,144	3,806	4,190	4,682
2026 Estimated Population	3,207	4,008	4,483	5,104
2027 Estimated Population	3,271	4,220	4,797	5,563
2028 Estimated Population	3,337	4,444	5,133	6,064
2029 Estimated Population	3,403	4,679	5,492	6,610
2030 Estimated Population	3,472	4,928	5,877	7,205
On-site Personnel Shortfall	**389**	**1,845**	**2,794**	**4,122**
Commercial SF	71,948 SF	341,309 SF	516,918 SF	762,562 SF

Legend: ND = no data; SF = square feet.

4.2 Navy Request for Information Responses

Private development requirements associated with Alternatives 2 and 3 were taken from the Request for Information (RFI) submittals received by the Navy in January 2019. The Navy received eleven responses to the RFI, and two provided a detailed development program for private development as shown in Table 4.2-1.

Table 4.2-1 Summary of Responses to Navy RFI

Private Development	*RFI 1*	*RFI 2*
Residential	2,000-3,600 Units	2,425 Units
Office	450,000 SF	987,700 SF
Hotel	250 Rooms	480 Rooms
Retail	300,000 SF	314,125 SF
Warehouse	275,000 SF	ND
Parking	4,500 stalls	ND

Legend: ND = no data; RFI = Request for Information; SF = square feet.
Source: RFIs received January 2019.

4.3 SANDAG Transit Center

The San Diego Association of Governments (SANDAG) initially identified OTC as a potential site for a Transit Center by submitting an RFI to the Navy. The OTC site was formally included in the 1 October 2019 Airport Connectivity Analysis report as an additional site to consider for a Central Mobility Hub with connectivity to/from the SDIA. For SANDAG to determine if OTC is the preferred location for the

Mobility Hub, it is conducting a separate parallel planning and design process to develop a SANDAG-supported public-private development project for OTC. As part of SANDAG's effort, they have contracted with LMA to conduct a Development Opportunity and Market Analyses for the OTC site with the Central Mobility Hub as a project element. The report provides market analyses for apartment rentals (residential), office, retail, and hotel.

The residential market analysis begins with a supply analysis based on a defined primary market area that includes East Village, Little Italy, and Mission Valley, all of which contain a competitive set of apartment projects. These projects were used to analyze the percent composition of studio, 1-bedroom, 2-bedroom, and 3-bedroom units and recommend a unit-mix for the OTC site as shown in Table 4.3-1. The report also discusses occupancy rates and rental rates that are less relevant to the formulation of alternatives for the EIS.

Table 4.3-1 Supply Analysis of Residential Unit Mix and Recommendation

Unit Type / Area	*East Village*	*Little Italy*	*Mission Valley*	*Recommendation*
Studio	20.4% / 757 Units	21.0% / 185 Units	6.5% / 80 Units	10-20%
1-bedroom	44/9% / 1,663 Units	49.2% / 434 Units	43.4% / 531 Units	30-45%
2-bedroom	25.6% / 949 Units	22.8% / 201 Units	43.8% / 536 Units	35-55%
3-bedroom	2.4% / 87 Units	3.2% / 28 Units	3.3% / 40 Units	0-5%

Source: LMA February 2020 Draft Report.

The residential market analysis also includes a demand analysis based on SANDAG's Central San Diego, Peninsula, and Mission Valley planning areas. SANDAG projects 43,726 additional multifamily units will be needed in those three planning areas from 2020 to 2040 as shown in Table 4.3-2. The table also shows the recommended low and high capture rate for the OTC site with the Transit Center included.

Table 4.3-2 Demand Analysis for Residential Units and Recommendation

Planning Area	*2020*	*2040*	*Growth*
Central San Diego	66,008	97,418	31,410
Mission Valley	13,004	18,388	5,384
Peninsula	12,390	19,322	6,932
Total	91,402	135,128	43,726
Recommended Low Units	ND	ND	8,000
Recommended Low %	ND	ND	18.3%
Recommended High Units	ND	ND	10,000
Recommended High %	ND	ND	22.9%

Legend: ND = no data in cell; % = percent
Source: LMA February 2020 Draft Report.

The office market analysis provides an overall County of San Diego analysis, as well as focus studies on Downtown and Mission Valley. For each area a 20-year historical inventory and asking rent is provided, as well as absorption rate, vacancy rate, and known future supply for all office and Class A. While this information is useful for determining the potential financial aspect of office space at OTC, it does not directly affect the development of EIS alternatives.

The office market analysis also includes a demand forecast for employment growth from 2020 to 2050 based on SANDAG data. The report provides a county-wide analysis of jobs by sector to determine the number of forecasted new jobs per year. This value is multiplied by 185 SF per person as an average size for a modern office space. The same analysis is applied to the forecasts for Downtown and Mission

Valley as these would be the areas OTC would draw from. The results identify a cumulative demand for new office space based on employment growth and identifies a range of potential capture the OTC project could obtain and recommends the 30% Capture rate as shown in Table 4.3-3. The report also analyzes the historic market capture rate for Downtown (11.5%) and Mission Valley (6.2%) as a percentage of the County as a whole. These are used to identify total demand values for Downtown and Mission Valley, and the same capture rate analysis was applied as shown in the table.

Table 4.3-3 Demand Analysis for Office Space and Recommendation

Demand	*Employment Growth*	*Market Capture*
Office Demand Downtown	1,520,633 SF	2,473,183 SF
Office Demand Mission Valley	424,868 SF	1,340,131 SF
40% Capture	778,200 SF	1,525,326 SF
30% Capture	583,650 SF	1,143,994 SF
20% Capture	389,100 SF	762,663 SF
Recommendation	583,650 SF	1,143,994 SF

Source: LMA February 2020 Draft Report.

The retail market analysis begins with a supply analysis for the County of San Diego, as well as focus studies on Downtown and Mission Valley. For each area a 15-year historical inventory and asking rent is provided, as well as absorption rate, and vacancy rate. While this information is useful for determining the potential financial aspect of office space at OTC, it does not directly affect the development of EIS alternatives.

The retail market demand analysis focuses on three contributing elements: residents, office workers, and visitor / passenger foot traffic.

To evaluate the potential contribution from future residents, Downtown's East Village neighborhood was used as a model. The average annual household income was determined to be $99,383. LMA also utilized data from the U.S. Economic Census that estimated 43.03% of household income is spent on retail expenditures. They reviewed the categories of expenditures in more detailed and identified those that could more likely happen within a neighborhood / community retail setting, such as that envisioned at OTC. This reduced the value to 31.3% of income as total and the capture rate for OTC was assumed to be 20%. Based on the previously recommended 8,000-10,000 residential units, the potential retail expenditures captured at OTC would be $48.5 - $60.6 million as shown in Table 4.3-4.

To evaluate the potential contribution from future office workers, LMA estimated the population associated with the proposed commercial office space (185 SF / worker) and the NAVWAR office space (225 SF / worker) to be between 7,656 and 10,685 employees. The average daily (260 days / yr) expenditure is estimated at $20 and the capture rate for OTC was assumed to be 20%. The potential retail expenditures captured at OTC would be $8.0 - $11.1 million as shown in Table 4.3-4.

To evaluate the potential contribution from future visitors / passengers, LMA estimated the daily population associated with transit use, airport connections, Navy visitors, hotel guests, and shopping visitors at 54,350 / day. This translates (people / day * 5.5 business days / week * 52 weeks) to an annual visitor / passenger population of 15,544,100. The average daily expenditure is estimated at $10 and the capture rate for OTC was assumed to be 5%. The potential retail expenditures captured at OTC would be approximately $7.8 million as shown in Table 4.3-4.

Table 4.3-4 Demand Analysis for Retail Space and Recommendation

Average Annual Income	$99,383	ND
% of Income spent in Neighborhood / Community Retail	31.3%	ND
% of Residential Retail Capture	20%	ND
Average Office Worker Daily Expenditure	$20	ND
% of Office Worker Retail Capture	20%	ND
Average Visitor/Passenger Daily Expenditure	$10	ND
% of Visitor/Passenger Retail Capture	5%	ND
Low Sales / SF	$400	ND
High Sales / SF	$500	ND
Total Units / Households	8,000	10,000
Total Annual Income	$796,064,000	$993,830,000
Neighborhood / Community Retail Expenditures	$242,270,732	$302,838,415
OTC Site Capture	**$48,454,146**	**$60,567,683**
Office Worker Population	7,656	10,685
Annual Office Worker Expenditures	$39,811,200	$55,562,000
OTC Site Capture	**$7,962,240**	**$11,112,400**
Daily Visitors / Passengers	54,350	54,350
Annual Visitors / Passengers	15,544,100	15,544,100
Visitor / Passenger Retail Expenditures	$155,441,000	$155,441,000
OTC Site Capture	**$7,772,050**	**$7,772,050**
Total OTC Retail Capture	**$64,188,436**	**$79,452,133**
Low Sales Total SF	160,471	198,630
High Sales Total SF	126,377	158,904

Legend: ND = no data in cell; % = percent; SF = square feet.
Source: LMA February 2020 Draft Report.

The hotel market analysis focused on two types of hotels: Limited Service and Boutique.

For the limited service hotel, seven hotels in Mission Valley were used as a competitive set and for the boutique hotel, 12 hotels in Downtown were used as a competitive set. Statistics on number of rooms, available room nights, average daily rates, revenue per available room, and occupancy rates were provided over a 10-yr period. While this information is useful for determining the potential financial aspect of hotel rooms at OTC, it does not directly affect the development of EIS alternatives. No summary tables of recommended rooms by hotel type were provided in the body of report.

The LMA summarizes the development recommendations for a Low Scenario and High Scenario as shown in Table 4.3-5.

Table 4.3-5 Summary of Land Use Recommendations with SANDAG Mobility Hub

Mobility Hub / Private Development	***Low Scenario***	***High Scenario***
Residential	8,000 Units	10,000 Units
Office	557,000 SF	1,100,000 SF
Hotel	200 Rm Limited Service and 250 Rm Boutique	200 Rm Limited Service and 250 Rm Boutique
Retail	120,000-160,000 SF	160,000-200,000 SF

Legend: Rm = room; SF = square feet.
Source: LMA February 2020 Draft Report.

5 Development Alternatives

To cover the full range of potential development intensities at the OTC, five future development scenarios have been developed as shown in Table 5.1-1.

Table 5.1-1 Summary of On-Site Development Alternatives

Development Type	*Alternative 1 - Navy Recapitalization*	*Alternative 2 – Highest Intensity w/o Transit Center*	*Alternative 3 – Lowest Intensity w/o Transit Center*	*Alternative 4 – Highest Intensity w/ Transit Center*	*Alternative 5 – Lowest Intensity w/ Transit Center*
NAVWAR Redevelopment	**Total SF / Equivalent Unit**				
Office	1,019,364 SF	845,326 SF	845,326 SF	845,326 SF	845,326 SF
Laboratory	174,865 SF	165,614 SF	165,614 SF	165,614 SF	165,614 SF
Auditorium	12,000 SF	15,000 SF	15,000 SF	15,000 SF	15,000 SF
Conference Rooms	14,156 SF	14,156 SF	14,156 SF	14,156 SF	14,156 SF
Warehouse	481,941 SF	24,172 SF	24,172 SF	24,172 SF	24,172 SF
Open Storage	174,267 SF	NI	NI	NI	NI
Parking	**Total SF / Equivalent Unit**	**Total SF / Equivalent Unit**	**Total SF / Equivalent Unit**	**Total SF / Equivalent Unit**	2,000 stalls / 630,000 SF
Mixed-Use Development	**Total SF / Equivalent Unit**	**Total SF / Equivalent Unit**	**Total SF / Equivalent Unit**	**Total SF / Equivalent Unit**	**Total SF / Equivalent Unit**
Residential	NI	6,600 Units / 6,336,000 SF	4,400 Units / 4,224,000 SF	10,000 Units / 9,600,000 SF	8,000 Units / 7,680,000 SF
Hotel	NI	400 Rooms / 260,000 SF	250 Rooms / 160,000 SF	450 Rooms / 290,000 SF	450 Rooms / 290,000 SF
Office	NI	1,000,000 SF	650,000 SF	1,350,000 SF	850,000 SF
Retail	NI	180,000 SF	130,000 SF	250,000 SF	200,000 SF
Transit Center	NI	NI	NI	140,000 SF	140,000 SF
Parking	NI	11,782 stalls / 4,123,700 SF	7,834 stalls / 2,741,900 SF	18,536 stalls / 6,487,600 SF	14,801 stalls / 5,180,350 SF
Alternative Total SF	**3,307,008 SF**	**13,593,968 SF**	**9,600,168 SF**	**19,811,868 SF**	**16,034,618 SF**

Legend: NI = not included in this alternative; SF = square feet.

5.1 Navy Recapitalization Plan

The lowest intensity alternative is a Navy-only 'Recapitalization Plan' as presented in Table 5.1-1 as Alternative 1. It utilizes the initial Navy requirements package from October 2019 which assumes all existing functions remain at OTC, no reductions in the parking requirement occurs, and no private or other public development is added to the site. The overall development footprint is about 3.31 million square feet.

5.2 Basis of Alternatives 2 through 5

All of the public-private development alternatives have been based in part on information identified in the LMA market analyses report described in Section 4.3. Two adjustments / corrections were made to the LMA retail analysis: 1) the estimate neighborhood / community retail expenditure percentage reported on 31.3% did not match the numeric calculation in the table, which was 30.5%. This lower percentage was utilized; and 2) the NAVWAR office worker population was estimated at 4,501, which is erroneous and the population from the November 2019 Requirements Package of 5,397 was used instead.

5.3 Public-Private Development without a Transit Center

Alternatives 2 and 3 establish the lowest development intensity and highest development intensity anticipated to be viable without a transit center. Both utilize the final Navy requirements package from November 2019 which assumes some functions (mainly warehouse and open storage) are moved off-site and the parking requirement is reduced by 56% to 2,000 stalls.

The lowest intensity public-private development alternative without the transit center is Alternative 3, as presented in Table 5.1-1. It uses a 10% demand capture for residential units at 4,400; office space at 20% of employment growth plus the 250,000 SF NAVWAR addition for 650,000 SF; and a single limited service hotel with 250 rooms. The LMA retail analysis was conducted based on the residential units and commercial office space values identified. The results were a range from about 87,000 to 109,000 SF. A 20% contingency was added for a target of 130,000 SF. The overall development footprint is about 9.6 million square feet.

The highest intensity public-private development alternative without the transit center is Alternative 2, as presented in Table 5.1-1. It uses a 15% demand capture for residential units at 6,600; office space at 20% of market capture plus the 250,000 SF NAVWAR addition for 1,000,000 SF; and a limited service hotel with 250 rooms plus a boutique hotel with 150 rooms. The LMA retail analysis was conducted based on the residential units and commercial office space values identified. The results were a range from about 118,000 to 147,000 SF. A 20% contingency was added for a target of 180,000 SF. The overall development footprint is approximately 13.6 million square feet.

5.4 Public-Private Development with a Transit Center

Alternatives 4 and 5 establish the lowest development intensity and highest development intensity anticipated to be viable with the inclusion of a transit center. Both utilize the final Navy requirements package from November 2019 which assumes some functions (mainly warehouse and open storage) are moved off-site and the parking requirement is reduced by 56% to 2,000 stalls.

The lowest intensity public-private development alternative with the transit center is Alternative 5, as presented in Table 5.1-1. It uses a 18% demand capture for residential units at 8,000; office space at 30% of employment growth plus the 250,000 SF NAVWAR addition for 850,000 SF; and a limited service hotel with 250 rooms plus a boutique hotel with 200 rooms. The LMA retail analysis was conducted based on the residential units and commercial office space values identified. The results were a range from about 133,000 to 166,000 SF. A 20% contingency was added for a target of 200,000 SF. The overall development footprint is about 16.0 million square feet.

The highest intensity public-private development alternative with the transit center is Alternative 4, as presented in Table 5.1-1. It uses a 23% demand capture for residential units at 10,000; office space at 30% of market capture plus the 250,000 SF NAVWAR addition for 1,350,000 SF; and a limited service hotel with 250 rooms plus a boutique hotel with 200 rooms. The LMA retail analysis was conducted based on the residential units and commercial office space values identified. The results were a range from about 163,000 to 204,000 SF. A 20% contingency was added for a target of 250,000 SF. The overall development footprint is about 19.8 million square feet.

5.5 Revitalization Timeline

Revitalization of the OTC property is proposed to be implemented over a 30-year period, utilizing a phased development approach. The intent would be to revitalize the property in stages with flexibility to accommodate market conditions. In all cases, the NAVWAR requirements would be constructed first, over a period of 5 years. Phasing over the remaining 25 years would fluctuate based on a variety of development and real estate factors. In general, the EIS team assumed 30% of the site would be developed by 2030 with full build out accomplished by 2050.

5.6 Use Calculations for Public-Private Development Uses

To develop a comparable range of alternatives for the EIS, a set of standardized calculations were required for the residential, hotel, office, and parking requirement aspects of the alternatives.

5.6.1 Residential

The RFI submittals presented the residential estimates as a total number of units. No information was provided on the mix of unit types or total footprint. As part of the SANDAG design development effort, their consulting team provided an estimate of the total footprint in SF required for the number of units being proposed. The average unit size is 960 SF per unit. This standard size was applied to the number of units within the public-private development alternatives to determine a total footprint of residential development.

5.6.2 Hotel

The RFI submittals presented the hotel estimates as a total number of rooms. No information was provided on the mix of room types or total footprint. As part of the SANDAG design development effort, their consulting team provided an estimate of the total footprint in SF required for the number of rooms being proposed. The average room size ranged from 500 SF per room to 625 SF per room. This square footage includes all aspects of the guest room block including check-in, corridor, elevators, stairways, laundry, and housekeeping storage. The EIS team researched hotel design standards and assumed a luxury hotel with 645 SF per room as the standard. This standard size was applied to the number of rooms within the public-private development alternatives to determine a total footprint of hotel.

Additionally, the RFI submittals provided a high value of 480 rooms, which was 30 rooms higher than the recommendation provided to SANDAG in the LMA report. Based on the more detailed LMA report, the 480-room proposal was reduced to 400 rooms being considered in Alternative 2.

5.6.3 Office

The commercial office portion of the public-private development alternatives was based on the information provided in the LMA report. The report identified that square footage per employee is trending downward, from 220-250 SF to 170-190 SF. They recommended using 185 SF per employee. As described in Section 4.1, an additional 250,000 SF of commercial office space was added to each alternative to capture the shift of NAVWAR HQ contractors being housed within the NAVWAR HQ office building to being required to be near OTC.

5.6.4 Parking

Parking requirements were not addressed in the RFI submittals or in early information from the SANDAG team. The EIS team chose to review the City of San Diego's Municipal Code (SDMC) for input on zoning that is applied to similar non-federal projects and used that information to identify potential parking ratios for each major use.

- The residential parking requirement was calculated at a rate of 1.5 spaces per 1,000 SF of area, which is the mid-point between a studio and a 3-to-4-bedroom unit per Table 142-05C within SDMC Article 2 Chapter 14.
- The office parking requirement was calculated at a rate of 1.5 spaces per 1,000 SF of area which is the minimum required outside a transit area for employment mixed-use (EMX) zones, per Table 142-05E within SDMC Article 2 Chapter 14. The 'outside a transit area' ratio was purposefully utilized instead of the 1.0 ratio for inside a transit area to partially account for the anticipated demand associated with the 56% parking requirement reduction specified by NAVWAR.
- The hotel parking requirement was calculated at a rate of 1.0 spaces per room which is the minimum required within a transit area per Table 142-05G within SDMC Article 2 Chapter 14.
- The retail parking requirement was calculated at a rate of 2.1 spaces per 1,000 SF of area which is the minimum required within a transit area per Table 142-05E within SDMC Article 2 Chapter 14 for zones CN 1-6, CV 1-2, CC 2-4, CC 3-6, CC 4-6, and CC 5-6.

The size of the parking stall was assumed to be 350 SF (8 feet-3 inches wide by 18 feet long, with a 24-foot aisle) per Tables 142-05K and 142-05L within SDMC Article 2 Chapter 14.

The SANDAG team presented parking stall counts and overall parking footprint requirements during the January 2020 coordination meetings. SANDAG's approach differed somewhat in the ratios utilized, and the assumed size of each parking stall (300 SF, or 8 feet wide by 18 feet long, with a 20-foot aisle). The EIS team re-calculated the parking requirements for Alternatives 4 and 5 to be consistent with Alternatives 2 and 3, as the EIS team's approach was more conservative.

The SANDAG team did not provide a parking requirement associated with the Transit Center. To be conservative, the EIS team developed a parking requirement based on an estimate of parking stalls / ridership at the Old Town Trolley Station. There are 430 parking stalls dedicated to the Old Town Trolley Station. Existing ridership of 31,400 per day was taken from the February 2017 Old Town Transit Center fact sheet published by SANDAG for the Mid-Coast project. These values indicate parking is provided for 1.4% of the ridership. This full demand is assumed to be moved into the new Transit Center within the OTC footprint. To estimate future ridership, 25% of the Mid-Coast ridership of 20,000 per day was assumed to get on / off at the new Transit Center. Additionally, the 20,400 per day estimate of ridership to / from SDIA identified in SANDAG's October 2019 Airport Connectivity Analysis was added. This creates a future ridership estimate of 56,800 per day. The EIS team increased the parking ratio to 2.0% of ridership to determine the requirement shown in Table 5.1-1.

6 Urban Form / Volumetric Massing

To translate the information presented in Table 5.1-1 into three-dimensional volumetric forms and associated urban forms, two additional components of development need to be factored in: site circulation and parkland.

6.1 Site Circulation

Site circulation, referring to public or private streets, can comprise a significant portion of a development site. The EIS team has made an initial estimate that 20% of the OTC will be used to improve / modify existing streets or add new public / private streets within the proposed development. The total area of the OTC for the two sites is 70.46 acres; therefore, 20% represents approximately 14.09 acres being dedicated to site circulation. That leaves 56.37 acres for development.

6.2 Parkland

Based on the residential component of Alternatives 2 through 5, additional population will be added to the Midway-Pacific Highway Community Plan Area (CPA), as well as the associated population-based park requirements established within the City's Recreation Element of the General Plan. To determine the potential population being added by the OTC development, the EIS team analyzed demographic information for the Downtown CPA.

The 2016 study 'Downtown San Diego: The Innovation Economy's Next Frontier' by the Downtown San Diego Partnership identified a population density of 1.19 per unit. The 2018 population and housing estimate from SANDAG's Data Surfer tool was downloaded for the Downtown CPA which provided a population of 54,303 within 27,341 housing units for a population density of 2.09 per unit. These were used to determine a low and high population estimate for the alternatives as shown in Table 6.2-1. The household size presented in the LMA report was 1.8, which is with the range the EIS team identified.

From the population estimates, a range of potential population-based parkland could be calculated based on the ratio of 2.80 acres per 1,000 population defined in the Recreation Element. As shown in Table 6.2-1, the potential parkland ranges from a low of 14.66 acres to a high of 58.52 acres.

Table 6.2-1 Population Estimates and Park Requirements

Category	*Alternative 2*	*Alternative 3*	*Alternative 4*	*Alternative 5*
Residential Units	6,600 Units	4,400 Units	10,000 Units	8,000 Units
Population / Unit – Low	1.19	1.19	1.19	1.19
Population / Unit – High	2.09	2.09	2.09	2.09
Population Estimate – Low	7,854	5,236	11,900	9,520
Population Estimate - High	13,794	9,196	20,900	16,720
Population-based Park Standard	2.80 AC per 1,000	2.80 AC per 1,000	2.80 AC per 1,000	2.80 AC per 1,000
Park Acreage – Low	21.99 AC	14.66 AC	33.32 AC	26.66 AC
Park Acreage - High	38.62 AC	25.75 AC	58.52 AC	46.82 AC

Legend: AC = acres.

6.3 Urban Form

With estimates for site circulation and parkland, an overall evaluation of urban form can be conducted. A basic gross floor area ratio (FAR) can be calculated by dividing the OTC site acreage by the development program for each alternative. When the development programs are converted from square feet to acres, they represent a range from 75.92 to 454.82 acres and gross FARs from 1.08 to 6.45 as shown in Table 6.3-1. This means that for Alternative 1, the entire site would be covered by a 1.08 story building to meet the development program, and Alternative 4 would require a 6.45 story building covering the entire site.

By removing the estimates for site circulation and parkland from the total OTC site, the net developable area can be compared to the proposed development program to determine an overall net FAR for each Alternative. As shown in Table 6.3-1, the net developable area ranges from a high of 56.37 acres for Alternative 1 to a low of -2.15 acres for the high population estimate for Alternative 4. Looking at Alternative 4 closer, the net developable area for the low population estimate is 23.05 acres, meaning the range of parkland requirements can exceed the capacity of the site.

Alternative 3 is estimated to have a FAR of 5.28 - 7.20, which can likely be accommodated with a mix of mid-rise (3 to 5 story) buildings and taller towers for the hotel and some of the office use.

Alternative 2 is estimated to have a FAR of 9.08 - 17.59, which would require a significant portion of the development to be in the form of taller towers for residential, hotel and office. Additionally, the parkland requirements may not be able to be fully met on-site.

Alternative 5 is estimated to have a FAR of 12.39 - 38.54, which means not only will the primary building form be tall towers, but the parkland requirements are not likely to be fully met on-site.

Alternative 4 is estimated to have a FAR of 29.73 or higher, which means the primary building form be tall towers and the parkland requirements will not be able to be fully met on-site.

Table 6.3-1 Floor Area Ratio Estimates

Category	*Alternative 1*	*Alternative 2*	*Alternative 3*	*Alternative 4*	*Alternative 5*
OTC Site (SF)	70.46 AC	70.46 AC	70.46 AC	70.46 AC	70.46 AC
Development Program (SF)	3,307,008 SF	13,593,968	9,600,168	19,811,868	16,034,618
Development Program (AC)	75.92 AC	215.61 AC	135.51 AC	464.78 AC	362.51 AC
Gross FAR	1.08	4.43	3.13	6.45	5.22
Site Circulation (20%)	14.09 AC	14.09 AC	14.09 AC	14.09 AC	14.09 AC
Park Acreage - Low	0 AC	21.99 AC	14.66 AC	33.32 AC	26.66 AC
Park Acreage - High	0 AC	38.63 AC	25.75 AC	58.52 AC	46.82 AC

1 Applicable Air Quality Regulations

1.1 Federal Regulations

Clean Air Act

The Clean Air Act (CAA) (40 Code of Federal Regulations [CFR] parts 50-99 and 40 CFR parts 1000-1099) is the comprehensive federal law that regulates air emissions from stationary and mobile sources. Among other things, this law authorizes United States (U.S.) Environmental Protection Agency (USEPA) to establish National Ambient Air Quality Standards (NAAQS) to protect public health and public welfare and to regulate emissions of hazardous air pollutants. The NAAQS are found in 40 CFR part 50 and are shown in Table D-1, shown on the next page.

One of the goals of the CAA was to set and achieve NAAQS in every state by 1975 in order to address the public health and welfare risks posed by certain widespread air pollutants. The setting of these pollutant standards was coupled with directing the states to develop state implementation plans (SIPs), applicable to appropriate industrial sources in the state, in order to achieve these standards. The CAA was amended in 1977 and 1990 primarily to set new goals (dates) for achieving attainment of NAAQS since many areas of the country had failed to meet the deadlines.

Section 111 of the CAA authorizes USEPA to develop technology-based standards which apply to specific categories of stationary sources. These standards are referred to as New Source Performance Standards (NSPS) and are found in 40 CFR part 60. The NSPS apply to new, modified and reconstructed affected facilities in specific source categories such as manufacturers of glass, cement, rubber tires and wool fiberglass.

Section 112 of CAA addresses national emission standards for hazardous air pollutants (NESHAPs) (40 CFR part 63). Prior to 1990, the CAA established a risk-based program under which only a few standards were developed. The 1990 CAA Amendments revised Section 112 to first require issuance of technology-based standards for major sources and certain area sources. “Major sources” are defined as a stationary source or group of stationary sources that emit or have the potential to emit 10 tons per year or more of a hazardous air pollutant (HAP) or 25 tons per year or more of a combination of HAPs. An “area source” is any stationary source that is not a major source.

For major sources, Section 112 requires that USEPA establish emission standards that require the maximum degree of reduction in emissions of HAPs. These emission standards are commonly referred to as “maximum achievable control technology” or “MACT” standards. Eight years after the technology-based MACT standards are issued for a source category, USEPA is required to review those standards to determine whether any residual risk exists for that source category and, if necessary, revise the standards to address such risk (USEPA, 2020a).

Table D-1 National and California Ambient Air Quality Standards

Ambient Air Quality Standards

Pollutant	Averaging Time	California Standards[1]		National Standards[2]		
		Concentration[3]	Method[4]	Primary[3,5]	Secondary[3,6]	Method[7]
Ozone (O_3)[8]	1 Hour	0.09 ppm (180 $\mu g/m^3$)	Ultraviolet Photometry	—	Same as Primary Standard	Ultraviolet Photometry
	8 Hour	0.070 ppm (137 $\mu g/m^3$)		0.070 ppm (137 $\mu g/m^3$)		
Respirable Particulate Matter (PM10)[9]	24 Hour	50 $\mu g/m^3$	Gravimetric or Beta Attenuation	150 $\mu g/m^3$	Same as Primary Standard	Inertial Separation and Gravimetric Analysis
	Annual Arithmetic Mean	20 $\mu g/m^3$		—		
Fine Particulate Matter (PM2.5)[9]	24 Hour	—	—	35 $\mu g/m^3$	Same as Primary Standard	Inertial Separation and Gravimetric Analysis
	Annual Arithmetic Mean	12 $\mu g/m^3$	Gravimetric or Beta Attenuation	12.0 $\mu g/m^3$	15 $\mu g/m^3$	
Carbon Monoxide (CO)	1 Hour	20 ppm (23 mg/m^3)	Non-Dispersive Infrared Photometry (NDIR)	35 ppm (40 mg/m^3)	—	Non-Dispersive Infrared Photometry (NDIR)
	8 Hour	9.0 ppm (10 mg/m^3)		9 ppm (10 mg/m^3)	—	
	8 Hour (Lake Tahoe)	6 ppm (7 mg/m^3)		—	—	
Nitrogen Dioxide (NO_2)[10]	1 Hour	0.18 ppm (339 $\mu g/m^3$)	Gas Phase Chemiluminescence	100 ppb (188 $\mu g/m^3$)	—	Gas Phase Chemiluminescence
	Annual Arithmetic Mean	0.030 ppm (57 $\mu g/m^3$)		0.053 ppm (100 $\mu g/m^3$)	Same as Primary Standard	
Sulfur Dioxide (SO_2)[11]	1 Hour	0.25 ppm (655 $\mu g/m^3$)	Ultraviolet Fluorescence	75 ppb (196 $\mu g/m^3$)	—	Ultraviolet Flourescence; Spectrophotometry (Pararosaniline Method)
	3 Hour	—		—	0.5 ppm (1300 $\mu g/m^3$)	
	24 Hour	0.04 ppm (105 $\mu g/m^3$)		0.14 ppm (for certain areas)[11]	—	
	Annual Arithmetic Mean	—		0.030 ppm (for certain areas)[11]	—	
Lead[12,13]	30 Day Average	1.5 $\mu g/m^3$	Atomic Absorption	—	—	High Volume Sampler and Atomic Absorption
	Calendar Quarter	—		1.5 $\mu g/m^3$ (for certain areas)[12]	Same as Primary Standard	
	Rolling 3-Month Average	—		0.15 $\mu g/m^3$		
Visibility Reducing Particles[14]	8 Hour	See footnote 14	Beta Attenuation and Transmittance through Filter Tape	No National Standards		
Sulfates	24 Hour	25 $\mu g/m^3$	Ion Chromatography			
Hydrogen Sulfide	1 Hour	0.03 ppm (42 $\mu g/m^3$)	Ultraviolet Fluorescence			
Vinyl Chloride[12]	24 Hour	0.01 ppm (26 $\mu g/m^3$)	Gas Chromatography			

See footnotes on next page …

For more information please call ARB-PIO at (916) 322-2990 California Air Resources Board (5/4/16)

1. California standards for ozone, carbon monoxide (except 8-hour Lake Tahoe), sulfur dioxide (1 and 24 hour), nitrogen dioxide, and particulate matter (PM10, PM2.5, and visibility reducing particles), are values that are not to be exceeded. All others are not to be equaled or exceeded. California ambient air quality standards are listed in the Table of Standards in Section 70200 of Title 17 of the California Code of Regulations.
2. National standards (other than ozone, particulate matter, and those based on annual arithmetic mean) are not to be exceeded more than once a year. The ozone standard is attained when the fourth highest 8-hour concentration measured at each site in a year, averaged over three years, is equal to or less than the standard. For PM10, the 24 hour standard is attained when the expected number of days per calendar year with a 24-hour average concentration above 150 $\mu g/m^3$ is equal to or less than one. For PM2.5, the 24 hour standard is attained when 98 percent of the daily concentrations, averaged over three years, are equal to or less than the standard. Contact the U.S. EPA for further clarification and current national policies.
3. Concentration expressed first in units in which it was promulgated. Equivalent units given in parentheses are based upon a reference temperature of 25°C and a reference pressure of 760 torr. Most measurements of air quality are to be corrected to a reference temperature of 25°C and a reference pressure of 760 torr; ppm in this table refers to ppm by volume, or micromoles of pollutant per mole of gas.
4. Any equivalent measurement method which can be shown to the satisfaction of the ARB to give equivalent results at or near the level of the air quality standard may be used.
5. National Primary Standards: The levels of air quality necessary, with an adequate margin of safety to protect the public health.
6. National Secondary Standards: The levels of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant.
7. Reference method as described by the U.S. EPA. An "equivalent method" of measurement may be used but must have a "consistent relationship to the reference method" and must be approved by the U.S. EPA.
8. On October 1, 2015, the national 8-hour ozone primary and secondary standards were lowered from 0.075 to 0.070 ppm.
9. On December 14, 2012, the national annual PM2.5 primary standard was lowered from 15 $\mu g/m^3$ to 12.0 $\mu g/m^3$. The existing national 24-hour PM2.5 standards (primary and secondary) were retained at 35 $\mu g/m^3$, as was the annual secondary standard of 15 $\mu g/m^3$. The existing 24-hour PM10 standards (primary and secondary) of 150 $\mu g/m^3$ also were retained. The form of the annual primary and secondary standards is the annual mean, averaged over 3 years.
10. To attain the 1-hour national standard, the 3-year average of the annual 98th percentile of the 1-hour daily maximum concentrations at each site must not exceed 100 ppb. Note that the national 1-hour standard is in units of parts per billion (ppb). California standards are in units of parts per million (ppm). To directly compare the national 1-hour standard to the California standards the units can be converted from ppb to ppm. In this case, the national standard of 100 ppb is identical to 0.100 ppm.
11. On June 2, 2010, a new 1-hour SO_2 standard was established and the existing 24-hour and annual primary standards were revoked. To attain the 1-hour national standard, the 3-year average of the annual 99th percentile of the 1-hour daily maximum concentrations at each site must not exceed 75 ppb. The 1971 SO_2 national standards (24-hour and annual) remain in effect until one year after an area is designated for the 2010 standard, except that in areas designated nonattainment for the 1971 standards, the 1971 standards remain in effect until implementation plans to attain or maintain the 2010 standards are approved.

    Note that the 1-hour national standard is in units of parts per billion (ppb). California standards are in units of parts per million (ppm). To directly compare the 1-hour national standard to the California standard the units can be converted to ppm. In this case, the national standard of 75 ppb is identical to 0.075 ppm.
12. The ARB has identified lead and vinyl chloride as 'toxic air contaminants' with no threshold level of exposure for adverse health effects determined. These actions allow for the implementation of control measures at levels below the ambient concentrations specified for these pollutants.
13. The national standard for lead was revised on October 15, 2008 to a rolling 3-month average. The 1978 lead standard (1.5 $\mu g/m^3$ as a quarterly average) remains in effect until one year after an area is designated for the 2008 standard, except that in areas designated nonattainment for the 1978 standard, the 1978 standard remains in effect until implementation plans to attain or maintain the 2008 standard are approved.
14. In 1989, the ARB converted both the general statewide 10-mile visibility standard and the Lake Tahoe 30-mile visibility standard to instrumental equivalents, which are "extinction of 0.23 per kilometer" and "extinction of 0.07 per kilometer" for the statewide and Lake Tahoe Air Basin standards, respectively.

State Implementation Plan

A SIP (40 CFR part 51-52) is a collection of regulations and documents used by a state, territory, or local air district to reduce air pollution in areas that do not meet the NAAQS. The San Diego Air Pollution Control District (SDAPCD) is responsible for implementing and enforcing state and federal air quality regulations in San Diego County. In coordination with California Air Resources Board (CARB) and San Diego Association of Governments (SANDAG), the SDAPCD prepares and implements air quality attainment plans for the San Diego County portion of the California SIP.

The ozone portion of the current SIP for San Diego County is titled *2008 Eight-Hour Ozone Attainment Plan for San Diego County* (SDAPCD, 2016a). It addresses the national 8-hour ozone standard of 0.075 parts per million (ppm) established by the USEPA in 2008 (hence the “2008” in the title). It identifies control measures and associated emission reductions needed to demonstrate attainment of the 2008 ozone standard by July 20, 2018. It relies on the SDAPCD’s Regional Air Quality Strategy, described below in Section D1.3, to demonstrate how the region will comply with the national ozone standard. In October 2020, the District Board approved the Final 2020 Plan for Attaining the National Ozone Standards (2020 Ozone Plan) (SDAPCD, 2020). In this plan, the SDAPCD requests that the USEPA re-designate San Diego County to severe nonattainment areas for both the 2008 and 2015 ozone NAAQS to allow more time to bring the region into attainment of these standards. The CARB approved the 2020 Ozone Plan on November 19, 2020 (CARB, 2020a) and submitted it to the USEPA on January 8, 2021 for consideration as a revision to the California SIP for attaining the ozone standards.

General Conformity Rule

CAA Section 176(c), commonly known as the USEPA General Conformity Rule, generally prohibits federal agencies from engaging in, supporting, permitting, or approving any activity that does not conform to the most recent USEPA-approved SIP (40 CFR part 93 subpart B). The General Conformity Rule applies to federal actions located in areas that are in nonattainment of a NAAQS or designated as maintenance areas (attainment areas that have been reclassified from a previous nonattainment status and are required to prepare an air quality maintenance plan). Conformity requirements only apply to criteria pollutants and their precursor emissions. If a conformity applicability analysis shows that the net annual direct and indirect emissions generated by a proposed action would be below *de minimis* thresholds, then the action would be exempt from any further requirements under the General Conformity Rule.

Mobile Source Air Toxics

HAPs emitted from mobile sources are called Mobile Source Air Toxics (MSATs). MSATs are compounds emitted from highway vehicles and nonroad equipment that are known or suspected to cause cancer or other serious health and environmental effects. In 2001, USEPA issued its first MSAT Rule, which identified 201 compounds as being HAPs that require regulation. A subset of six of the MSAT compounds was identified as having the greatest influence on health and included benzene, butadiene, formaldehyde, acrolein, acetaldehyde, and diesel particulate matter (DPM). More recently, USEPA issued a second MSAT Rule in February 2007, which generally supported the findings in the first rule and provided additional recommendations of compounds having the greatest impact on health. The rule also identified several engine emission certification standards that must be implemented (40 CFR parts 59, 80, 85, and 86; Federal Register Volume 72, No. 37, pp. 8427–8570, 2007). Unlike the criteria pollutants, there are no NAAQS for benzene and other HAPs. The primary control methodologies for these pollutants for mobile sources involves reducing their content in fuel and altering the engine operating characteristics to reduce the volume of pollutant generated during combustion.

Federal Vehicle Standards for Greenhouse Gases

In 2007, President Bush directed the USEPA, the Department of Transportation, and the Department of Energy to establish regulations that reduce greenhouse gases (GHG) emissions from motor vehicles, nonroad vehicles, and nonroad engines by 2008. In 2009, the National Highway Traffic Safety Administration (NHTSA) issued a final rule regulating fuel efficiency for and GHG emissions from cars and light-duty trucks for model year 2011; and in 2010, the USEPA and NHTSA issued a final rule regulating cars and light-duty trucks for model years 2012–2016.

In 2010, President Obama issued a memorandum directing the same federal agencies to establish additional standards regarding fuel efficiency and GHG reduction, clean fuels, and advanced vehicle infrastructure. In response to this directive, the USEPA and NHTSA proposed Corporate Average Fuel Economy standards for model year 2017–2025 light-duty vehicles. The proposed standards are projected to achieve 163 grams per mile of carbon dioxide (CO_2) in model year 2025, on an average industry fleet-wide basis, which is equivalent to 54.5 miles per gallon if this level were achieved solely through fuel efficiency. The final rule was adopted in 2012 for model years 2017–2021.

In August 2017, the USEPA asked for additional information and data relevant to assessing whether the GHG emissions standards for model years 2022–2025 remain appropriate. In early 2018, the USEPA Administrator announced that the midterm evaluation for the GHG emissions standards for cars and light-duty trucks for model years 2022–2025 was completed and stated his determination that the current standards should be revised in light of recent data. Subsequently, in 2018, the USEPA and NHTSA proposed to amend certain existing Corporate Average Fuel Economy standards and tailpipe carbon dioxide emissions standards for passenger cars and light trucks and establish new standards, covering model years 2021–2026. Compared to maintaining the post-2020 standards now in place, the pending proposal would increase U.S. fuel consumption. California and other states have announced their intent to challenge federal actions that would delay or eliminate GHG reductions. Because the pending proposal is still in the rulemaking phase, and because legal challenges to any future adoption of the proposal is likely, the timing and consequences of the pending proposal are speculative at this time.

In addition to the regulations applicable to cars and light-duty trucks described above, in 2011, the USEPA and NHTSA announced fuel economy and GHG standards for medium- and heavy-duty trucks for model years 2014–2018. The standards for CO_2 emissions and fuel consumption are tailored to three main vehicle categories: combination tractors, heavy-duty pickup trucks and vans, and vocational vehicles.

The implementation of this program was adopted in two phases. Phase 1 was adopted in 2011, which applied to vehicles from model years 2014–2018. This phase was intended to reduce fuel use and GHG emissions from medium- and heavy-duty vehicles, semi-trucks, pickup trucks and vans, and all work trucks and buses. According to USEPA, this program will reduce GHG emissions and fuel consumption for affected vehicles by 9 to 23 percent over the 2010 baselines. Phase 2 was adopted in 2016 for medium- and heavy-duty trucks for model years 2018 and beyond. This phase was intended to include technology-advancing standards that substantially reduce GHG emissions and fuel consumption resulting in an ambitious, yet achievable program that will allow manufacturers to meet the applicable standards over time, at reasonable cost, through a mix of different technologies. For semi-trucks, large pickup trucks, vans, and other trucks, Phase 2 standards will be phased in beginning with model year 2021 and culminating with model year 2027. While this regulation focuses on the reduction of GHG emissions, it is anticipated that this regulation would also help reduce criteria air pollutants.

Safer Affordable Fuel-Efficient Vehicles Rule

On September 27, 2019, USEPA and the NHTSA published the “Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule Part One: One National Program” (84 Federal Register 51,310 [September 27, 2019]). The Part One Rule revokes California’s authority to set its own greenhouse gas emissions standards and zero-emission vehicle mandates in California. On January 20, 2021, President Biden issued Executive Order (EO) 13990, which ordered the USEPA and NHTSA to consider, by July 2021, publishing for notice and comment a proposed rule suspending, revising, or rescinding the SAFE Vehicles Rule.

Federal Energy Independence and Security Act

The Energy Independence and Security Act of 2007 facilitates the reduction of national GHG emissions by requiring the following:

- Increasing the supply of alternative fuel sources by setting a mandatory Renewable Fuel Standard that requires fuel producers to use at least 36 billion gallons of biofuel in 2022.
- Prescribing or revising standards affecting regional efficiency for heating and cooling products, procedures for new or amended standards, energy conservation, energy efficiency labeling for consumer electronic products, residential boiler efficiency, electric motor efficiency, and home appliances.
- Requiring approximately 25 percent greater efficiency for light bulbs by phasing out incandescent light bulbs between 2012 and 2014; requiring approximately 200 percent greater efficiency for light bulbs, or similar energy savings, by 2020.
- While superseded by the USEPA and NHTSA actions described above, (i) establishing miles per gallon targets for cars and light trucks and (ii) directing the NHTSA to establish a fuel economy program for medium- and heavy-duty trucks and create a separate fuel economy standard for trucks.

Additional provisions of the Energy Independence and Security Act address energy savings in government and public institutions, and promote research for alternative energy, additional research in carbon capture, international energy programs, and the creation of “green jobs”.

1.2 California Regulations

California Ambient Air Quality Standards

In 1959 the California Legislature directed the State Department of Public Health to develop California Ambient Air Quality Standards (CAAQS). The original CAAQS were established in 1962. The CARB was created by the legislature in 1967, and the CAAQS that had been set by the Department of Public Health were subsequently adopted by CARB in 1969. Thus, the CAAQS predate the NAAQS set by USEPA, which was created in 1970, and issued its first NAAQS in 1971. California law continues to mandate CAAQS, although attainment of the NAAQS has precedence over attainment of the CAAQS due to federal penalties for failure to meet federal attainment deadlines. The CAAQS are shown in Table D-1. (CARB, 2020b).

California Health and Safety Code Section 41700

This section of the Health and Safety Code states that a person shall not discharge from any source whatsoever quantities of air contaminants or other material that cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or that endanger the comfort, repose, health, or safety of any of those persons or the public, or that cause, or have a natural tendency to cause, injury or damage to business or property. This section also applies to sources of objectionable odors.

In-Use Off-Road Diesel-Fueled Fleets

These regulations reduce DPM and nitrogen oxides (NO_x) emissions from in-use, off-road heavy-duty diesel vehicles in California. Such vehicles typically are used in construction, mining, and industrial operations. The regulations, among other requirements, impose limits on idling; require all vehicles to be reported to CARB (using the Diesel Off-Road Online Reporting System) and labeled; restrict the adding of older vehicles into fleets; and require fleets to reduce their emissions by retiring, replacing, or repowering older engines, or installing Verified Diesel Emission Control Strategies (i.e., exhaust retrofits).

The requirements and compliance dates of the regulations vary by fleet size. Large fleets have compliance deadlines each year from 2014 through 2023, medium fleets each year from 2017 through 2023, and small fleets each year from 2019 through 2028 (13 California Code of Regulations [CCR] 2449).

In-Use On-Road Diesel-Fueled Fleets

These regulations require diesel trucks and buses to be upgraded to reduce emissions; newer heavier trucks and buses must meet particulate matter (PM) filter requirements; lighter and older heavier trucks must be replaced; and, by January 1, 2023, nearly all trucks and buses will need to have 2010 model year engines or equivalent.

The regulation applies to nearly all privately and federally owned diesel-fueled trucks and buses, and to privately and publicly owned school buses with a gross vehicle weight rating greater than 14,000 pounds. The regulation provides flexibility options tailored to fleets operating low use vehicles, fleets operating in selected vocations like agricultural and construction, and small fleets of three or fewer trucks.

California Air Toxics Program (Assembly Bill 1807 and Assembly Bill 2588)

The state Air Toxics Program was established in 1983 under Assembly Bill (AB) 1807 (Tanner). The California toxic air contaminant (TAC) list identifies more than 700 pollutants, of which carcinogenic and non-carcinogenic toxicity criteria have been established for a subset of these pollutants pursuant to the California Health and Safety Code. In accordance with AB 2728, the state TAC list includes the federal HAPs.

The Air Toxics "Hot Spots" Information and Assessment Act of 1987 (AB 2588) seeks to identify and evaluate risk from stationary air toxics sources; however, AB 2588 does not reduce the quantity of air toxics emissions. Instead, under AB 2588, TAC emissions from individual facilities are quantified and prioritized. "High-priority" facilities are required to perform a health risk assessment (HRA), and if specific thresholds are exceeded, are required to communicate the results to the public in the form of notices and public meetings.

In 2000, CARB approved a comprehensive Diesel Risk Reduction Plan to reduce diesel emissions from both new and existing diesel-fueled vehicles and engines. The plan was anticipated to result in an 80 percent decrease in statewide diesel health risk in 2020 compared with the diesel risk in 2000. Additional regulations apply to new trucks and diesel fuel, including the On-Road Heavy-Duty Diesel Vehicle (In-Use) Regulation, the On-Road Heavy-Duty (New) Vehicle Program, the In-Use Off-Road Diesel Vehicle Regulation, and the New Off-Road Compression Ignition (Diesel) Engines and Equipment program. These regulations and programs have timetables by which manufacturers must comply and existing operators must upgrade their diesel-powered equipment. There also are several Airborne Toxic Control Measures (ATCMs) that reduce diesel emissions, including In-Use Off-Road Diesel-Fueled Fleets (13 CCR 2449 et seq.) and In-Use On-Road Diesel-Fueled Vehicles (13 CCR 2025).

Airborne Toxic Control Measure for Diesel-Fueled Commercial Motor Vehicle Idling

This ATCM applies to diesel-fueled commercial motor vehicles with gross vehicular weight ratings of greater than 10,000 pounds that are or must be licensed for operation on highways. The measure limits idling of trucks to a maximum of 5 minutes, except when the vehicle is queuing (13 CCR 2485). While this

ATCM focuses on the reduction of DPM emissions as a TAC, this regulation would also help reduce criteria air pollutants.

Airborne Toxic Control Measure for Stationary Compression Ignition Engines

This ATCM establishes emission standards and fuel use requirements for new and in-use stationary engines used in non-agricultural prime and emergency back-up applications and for new stationary engines used in agricultural applications (17 CCR 93115). While this ATCM focuses on the reduction of DPM emissions as a TAC, this regulation would also help reduce criteria air pollutants.

Executive Order S-3-05 (Statewide Greenhouse Gases Emission Targets)

In 2005, Governor Schwarzenegger issued EO S-3-05, which identifies statewide GHG emission reduction targets to achieve long-term climate stabilization as follows:

- Reduce GHG emissions to 1990 levels by 2020
- Reduce GHG emissions to 80 percent below 1990 levels by 2050

In response to EO S-3-05, the California Environmental Protection Agency created the Climate Action Team (CAT), which in March 2006 published the Climate Action Team Report (2006 CAT Report; California Environmental Protection Agency, 2006). The 2006 CAT Report identified a recommended list of strategies that the state could pursue to reduce GHG emissions. These strategies could be implemented by various state agencies to ensure that the emission reduction targets in EO S-3-05 are met and can be met with existing authority of the state agencies. The strategies include, but are not limited to, the reduction of passenger and light-duty truck emissions, the reduction of idling times for diesel trucks, an overhaul of shipping technology and infrastructure, increased use of alternative fuels, increased recycling, and landfill methane capture.

California Global Warming Solutions Act (Assembly Bill 32)

In response to EO S-3-05, the California Legislature passed AB 32 (Nunez), the California Global Warming Solutions Act of 2006. The heart of AB 32 is the requirement that statewide GHG emissions be reduced to 1990 levels by 2020. To achieve this reduction mandate, AB 32 requires CARB to adopt rules and regulations in an open public process that achieve the maximum technologically feasible and cost-effective GHG reductions.

In 2007, CARB approved a statewide limit on the GHG emissions level for year 2020 consistent with the determined 1990 baseline. CARB's adoption of this limit is in accordance with Health & Safety Code Section 38550, as codified through enactment of AB 32.

Per Health & Safety Code Section 38561(b), CARB also is required to prepare, approve, and amend a scoping plan that identifies and makes recommendations on "direct emission reduction measures, alternative compliance mechanisms, market-based compliance mechanisms, and potential monetary and nonmonetary incentives for sources and categories of sources that [CARB] finds are necessary or desirable to facilitate the achievement of the maximum feasible and cost-effective reductions of GHG emissions by 2020".

2008 Scoping Plan

In 2008, CARB adopted the *Climate Change Scoping Plan: A Framework for Change* (2008 Scoping Plan) in accordance with Health & Safety Code Section 38561. During the development of the 2008 Scoping Plan, CARB created a planning framework that is comprised of eight emissions sectors: (1) transportation, (2) electricity, (3) commercial and residential, (4) industry, (5) recycling and waste, (6) high global warming potential (GWP) gases, (7) agriculture, and (8) forest net emissions.

The 2008 Scoping Plan establishes an overall framework for the measures that will be adopted to reduce California's GHG emissions from the eight emissions sectors to 1990 levels by 2020. In the Scoping Plan, CARB determined that achieving the 1990 emissions level in 2020 would require a reduction in GHG emissions of approximately 28.5 percent from the otherwise projected 2020 emissions level; (i.e., those emissions that would occur in 2020), absent GHG-reducing laws and regulations (referred to as "Business-As-Usual" [BAU]) (CARB 2008). For example, in further explaining CARB's BAU methodology, CARB assumed that all new electricity generation would be supplied by natural gas plants, no further regulatory action would impact vehicle fuel efficiency, and building energy efficiency codes would be held at 2005 standards.

To achieve the necessary GHG reductions to meet the 2020 target, CARB developed a series of reduction measures in the Scoping Plan covering a range of sectors and activities. Broadly, the reduction measures can be separated into capped sectors (i.e., covered by the Cap-and-Trade Program discussed below) and uncapped sectors.

Multiple Scoping Plan measures broadly cover emissions associated with new residential and commercial land use development, including, but not limited to, the following:

- Energy Efficiency/Green Buildings. The Scoping Plan highlights the importance of energy efficiency efforts in reducing GHG emissions from residential and commercial development and indicates that zero net energy should be the overarching and unifying concept for energy efficiency.
- Regional Transportation-Related GHG Targets. The Scoping Plan relies on Senate Bill (SB) 375, discussed below, as an important mechanism to reduce mobile GHG emissions by integrating land use planning and transportation planning at the regional and local level.
- Vehicle Emissions. The Scoping Plan relies on various engine, fuel, and other efficiency improvement programs and increasing electrification of the vehicle fleet.
- Cap-and-Trade Program. The Scoping Plan identifies the Cap-and-Trade Program as a lynchpin, overarching strategy for California to reduce GHG emissions. As explained in the Scoping Plan, the program's implementing regulations provide assurance that California's 2020 limit will be met because the regulation sets a firm limit on 85 percent of California's GHG emissions.

In the 2011 Final Supplement to the AB 32 Scoping Plan Functional Equivalent Document (2011 Final Supplement; CARB, 2011), CARB revised its estimates of the projected 2020 emissions level in light of the economic recession and the availability of updated information about GHG reduction regulations. Based on the new economic data, CARB determined that achieving the 1990 emissions level by 2020 would require a reduction in GHG emissions of 21.7 percent (down from 28.5 percent) from the BAU conditions. When the 2020 emissions level projection also was updated to account for newly implemented regulatory measures, including Pavley I (model years 2009–2016) and the Renewables Portfolio Standard (12 to 20 percent), CARB determined that achieving the 1990 emissions level in 2020 would require a reduction in GHG emissions of 16 percent (down from 28.5 percent) from the BAU conditions (CARB, 2011).

2014 First Update to the Scoping Plan

In 2014, CARB adopted the first update to the Scoping Plan titled Climate Change Scoping Plan: Building on the Framework (2014 First Update). The stated purpose of the 2014 First Update is to "highlight […] California's success to date in reducing its GHG emissions and lay […] the foundation for establishing a broad framework for continued emission reductions beyond 2020, on the path to 80 percent below 1990 levels by 2050" (CARB, 2014a). The 2014 First Update found that California is on track to meet the 2020 emissions reduction mandate established by AB 32 and noted that California could reduce emissions further by 2030 to levels squarely in line with those needed to stay on track to reduce emissions to 80 percent below 1990 levels by 2050 if the state realizes the expected benefits of existing policy goals (CARB, 2014a).

In conjunction with the 2014 First Update, CARB identified "six key focus areas comprising major components of the state's economy to evaluate and describe the larger transformative actions that will be needed to meet the state's more expansive emission reduction needs by 2050" (CARB, 2014a). Those six areas are: (1) energy; (2) transportation (vehicles/equipment, sustainable communities, housing, fuels, and infrastructure); (3) agriculture; (4) water; (5) waste management; and (6) natural and working lands. The 2014 First Update identifies key recommended actions for each sector that will facilitate achievement of the 2050 reduction target.

Based on CARB's research efforts, it has a "strong sense of the mix of technologies needed to reduce emissions through 2050" (CARB, 2014a). Those technologies include energy demand reduction through efficiency and activity changes; large-scale electrification of on-road vehicles, buildings, and industrial machinery; decarbonizing electricity and fuel supplies; and the rapid market penetration of efficient and clean energy technologies.

As part of the 2014 First Update, CARB recalculated the state's 1990 emissions level using more recent GWPs identified by the Intergovernmental Panel on Climate Change (IPCC). Using the recalculated 1990 emissions level and the revised 2020 emissions level projection identified in the 2011 Final Supplement, CARB determined that achieving the 1990 emissions level by 2020 would require a reduction in GHG emissions of approximately 15.3 percent (instead of 28.5 percent or 16 percent) from the BAU conditions.

Executive Order B-30-15 (2030 Statewide Greenhouse Gas Emission Goal)

This EO, issued by Governor Brown on April 29, 2015, established an interim GHG emission reduction goal for the state of California: by 2030, reduce GHG emissions to 40 percent below 1990 levels. This EO also directed all state agencies with jurisdiction over GHG emitting sources to implement measures designed to achieve the new interim 2030 goal as well as the preexisting long-term 2050 goal identified in EO S-3-05. Additionally, this EO directed CARB to update its mandated Scoping Plan to address the 2030 goal.

Senate Bill 32 and Assembly Bill 197

Enacted in 2016, SB 32 (Pavley, 2016) codified the 2030 emissions reduction goal of EO B-30-15 by requiring CARB to ensure that statewide GHG emissions are reduced to 40 percent below 1990 levels by 2030.

SB 32 was coupled with a companion bill, AB 197 (Garcia, 2016). Designed to improve the transparency of CARB's regulatory and policy-oriented processes, AB 197 created the Joint Legislative Committee on Climate Change Policies, a committee with the responsibility to ascertain facts and make recommendations to the Legislature concerning statewide programs, policies, and investments related to climate change. AB 197 also requires CARB to make certain GHG emissions inventory data publicly available on its web site; consider the social costs of GHG emissions when adopting rules and regulations designed to achieve GHG emission reductions; and include specified information in all Scoping Plan updates for the emission reduction measures contained therein.

2017 Climate Change Scoping Plan

In November 2017, CARB released the 2017 Climate Change Scoping Plan Update, The Strategy for Achieving California's 2030 Greenhouse Gas Target (2017 Scoping Plan) (CARB, 2017). The 2017 Scoping Plan identifies strategies that would achieve the 2030 emission reduction target codified by SB 32. Measures under the 2017 Scoping Plan build on existing programs such as the Cap-and-Trade Program, Low Carbon Fuel Standard, Advanced Clean Cars Program, Renewables Portfolio Standard, Sustainable Communities Strategy (SCS), and Short-Lived Climate Pollutant Reduction Strategy.

Cap-and-Trade Program

California's Cap-and-Trade Program (17 CCR 95800–96022) regulates the emissions of large electric power plants, large industrial plants, and fuel distributors (including transportation fuel and natural gas). These sources are responsible for about 85 percent of the state's total GHG emissions inventory (CARB, 2015). In the Cap-and-Trade Program, the state regulates the quantity of emissions by determining in advance, how many allowances to issue—i.e., setting the "cap." Each allowance is essentially a permit issued by the state authorizing a certain quantity of GHG emissions. There are only a finite number of allowances, ensuring that covered entities may only lawfully emit a certain quantity of GHGs. If a covered entity wishes to emit carbon, it must obtain allowances to authorize those emissions.

Importantly, the Cap-and-Trade Program has been designed to provide a firm cap, ensuring that the 2020 statewide emissions limit identified by CARB in the 2008 Scoping Plan will not be exceeded (CARB, 2008). Thus, for the emission sources covered by the Program, which are nearly all of the sources associated with land use development projects, compliance with the AB 32 2020 mandate is assured by the Cap-and-Trade Program.

AB 398 (2017) extended the statutory horizon year of the Cap-and-Trade Program to December 31, 2030, thereby facilitating continued reliance on the Cap-and-Trade Program for purposes of achieving SB 32's 2030 statewide reduction target.

Executive Order B-55-18

In September 2018, Governor Brown signed EO B-55-18, which established a new statewide goal "to achieve carbon neutrality as soon as possible, and no later than 2045, and achieve and maintain net negative emissions thereafter." This EO directs CARB to "work with relevant state agencies to ensure future Scoping Plans identify and recommend measures to achieve the carbon neutrality goal."

In January 2019, CARB held a workshop regarding carbon neutrality in California, during which CARB staff explained that the definitional parameters and meaning of the term *carbon neutrality* are still being explored (CARB, 2019a). CARB intends to hold additional workshops to explore specific topics related to the pursuit of carbon neutrality, engage with other experts in the field and stakeholders, and conduct research to ensure that any path to carbon neutrality balances scientific, economic, and social justice principles.

Renewables Portfolio Standard

As most recently amended by SB 100 (2018), California's Renewables Portfolio Standard requires retail sellers of electric services and local publicly owned electric utilities to increase procurement from eligible renewable energy resources to 50 percent of total retail sales by 2026 and 60 percent of total retail sales by 2030. SB 100 also established a state policy goal to achieve 100 percent renewables by 2045.

California Energy Efficiency Standards (Title 24, Part 6)

Title 24, Part 6 of the CCR is the California Energy Efficiency Standards for Residential and Nonresidential Buildings (also known as the California Energy Code). This code, originally enacted in 1978 in response to legislative mandates, establishes energy efficiency standards for residential and nonresidential buildings to reduce California's energy consumption. The Energy Code is updated periodically to incorporate and to consider new energy efficiency technologies and methodologies as they become available. Incentives in the form of rebates and tax breaks are provided on a sliding scale for buildings achieving energy efficiency above the minimum standards.

The current version of the Energy Code, known as 2016 Title 24, or the 2016 Energy Code, became effective January 1, 2017. The 2016 Energy Code provides mandatory energy efficiency measures as well as voluntary tiers for increased energy efficiency. The California Energy Commission (CEC), in conjunction with the California Public Utilities Commission, has adopted a goal that all new residential and commercial construction achieve zero net energy by 2020 and 2030, respectively.

The next version of the Energy Code, known as the 2019 Energy Code, was adopted May 9, 2018 and became effective on January 1, 2020. The 2019 Energy Code includes provisions for smart residential photovoltaic (PV) systems, updated thermal envelope standards (preventing heat transfer from the interior to exterior and vice versa), residential and nonresidential ventilation requirements, and nonresidential lighting requirements. The new Energy Code aims to reduce energy use in new homes by requiring that all new homes include individual or community solar PV systems or community shared battery storage systems that achieve equivalent time-dependent value energy use reduction. Accounting for solar PV requirements, the CEC's preliminary estimates indicate that homes built consistent with the 2019 Energy Code will result in 53 percent less energy use than those built under the 2016 standards.

California Green Building Standards (California Green Building Standards Code; Title 24, Part 11)

CCR Title 24, Part 11 is the California Green Building Standards. Beginning in 2011, the California Green Building Standards Code (CalGreen) instituted mandatory minimum environmental performance standards for all ground-up new construction of commercial and residential buildings, state-owned buildings, schools, and hospitals. It also includes voluntary tiers (I and II) with stricter environmental performance standards for these same categories of residential and nonresidential buildings. Local jurisdictions must enforce the minimum mandatory requirements and may adopt CalGreen with amendments for stricter requirements.

The mandatory standards require:

- 20 percent mandatory reduction in indoor water use relative to specified baseline levels
- 65 percent construction and demolition waste diverted from landfills (please note, AB 341 established a 75 percent diversion target)
- inclusion of electric vehicle charging stations or designated spaces capable of supporting future charging stations

- mandatory inspections of energy systems to ensure optimal working efficiency
- requirements for low-pollutant emitting exterior and interior finish materials such as paints, carpets, vinyl flooring, and particle boards

The voluntary standards require:

- Tier I – 15 percent improvement in energy requirements, stricter water conservation requirements for specific fixtures, 65 percent reduction in construction waste, 10 percent recycled content, 20 percent permeable paving, 20 percent cement reduction, cool or solar reflective roof; electrical vehicle charging.
- Tier II – 30 percent improvement in energy requirements, stricter water conservation requirements for specific fixtures, 75 percent reduction in construction waste, 15 percent recycled content, 30 percent permeable paving, 25 percent cement reduction, cool or solar reflective roof, and electrical vehicle charging.

Similar to the compliance reporting procedure described above for demonstrating code compliance under Title 24, Part 6, in new buildings and major renovations, compliance with the CalGreen water reduction requirements must be demonstrated through completion of water use reporting forms for new residential and nonresidential buildings. The water use compliance forms must demonstrate a 20 percent reduction in indoor water use by either showing a 20 percent reduction in the overall baseline water use as identified in CalGreen or a reduced per-plumbing-fixture water use rate.

The CARB Scoping Plan includes a Green Building Strategy with the goal of expanding the use of green building practices to reduce the carbon footprint of new and existing buildings. Consistent with CalGreen, the Scoping Plan recognized that GHG reductions would be achieved through buildings that exceed minimum energy efficiency standards, decrease consumption of potable water, reduce solid waste during construction and operation, and incorporate sustainable materials. California Public Utilities Commission, CEC, and CARB have a shared goal of achieving zero net energy for new construction in California. The key policy timelines include (1) all new residential construction in California will be zero net energy by 2020 and (2) all new commercial construction in California will be zero net energy by 2030. Green building is thus a vehicle to achieve the Scoping Plan's statewide electricity and natural gas efficiency targets, and lower GHG emissions from waste and water transport sectors.

In the Scoping Plan, CARB projects that an additional 26.3 million metric tons of carbon dioxide equivalent (CO_2e) could be reduced through expanded green building standards. However, to avoid any double counting, this reduction is not counted toward the BAU 2020 reduction goal, as most of these reductions are accounted for in the electricity, waste, and water sectors. Because of this, CARB has assigned all emissions reductions that occur because of green building strategies to other sectors for meeting AB 32 requirements but will continue to evaluate and refine the emissions from this sector.

Title 20 Appliance Standards

The CEC periodically amends and enforces Appliance Efficiency Regulations contained in Title 20 of the CCR. The regulations establish water and energy efficiency standards for both federally regulated appliances and non-federally regulated appliances. The regulations cover numerous categories of appliances (e.g., refrigerators; plumbing fixtures; dishwashers; clothes washer and dryers; televisions) and apply to appliances offered for sale in California.

Senate Bill 375 (Sustainable Communities and Climate Protection Act)

SB 375 (Steinberg, 2008), the Sustainable Communities and Climate Protection Act, coordinates land use planning, regional transportation plans, and funding priorities to reduce GHG emissions from passenger vehicles through better-integrated regional transportation, land use, and housing planning that provides easier access to jobs, services, public transit, and active transportation options. SB 375 specifically requires the Metropolitan Planning Organization relevant to the project area (the SANDAG) to include a SCS in its Regional Transportation Plan (RTP) that, if implemented, will achieve GHG emission reduction targets set by CARB by reducing vehicle miles traveled (VMT) from light-duty vehicles through the development of more compact, complete, and efficient communities.

Assembly Bill 341 (Solid Waste Diversion)

AB 241 mandates that businesses that generate 4 cubic yards or more of commercial solid waste per week and multi-family residences with five units or more arrange for recycling services. Businesses can take one or any combination of measures to reuse, recycle, compost, or otherwise divert solid waste from disposal. Additionally, AB 341 mandates that 75 percent of the solid waste generated be reduced, recycled, or composted by 2020.

Senate Bill 743

Public Resources Code Section 21099(c)(1), as codified through enactment of SB 743 (Steinberg, 2013), authorized the Office of Planning and Research to establish “alternative metrics to the metrics used for traffic levels of service for transportation impacts outside transit priority areas.” SB 743 reflects a legislative policy to balance the needs of congestion management with statewide goals related to infill development, promotion of public health through active transportation, and reduction of GHG emissions. As finalized in December 2018, amendments to the California Environmental Quality Act (CEQA) Guidelines adopted in furtherance of SB 743 established VMT, in lieu of level of service, as the new metric for transportation analysis.

Assembly Bill 1493 (Pavley Regulations)

AB 1493 (Pavley) directed CARB to adopt vehicle standards that lowered GHG emissions from passenger vehicles and light-duty trucks to the maximum extent technologically feasible, beginning with the 2009 Model Year. CARB has adopted amendments to its regulations that would enforce AB 1493 but provide vehicle manufacturers with new compliance flexibility. Pavley standards are currently divided into two phases. Standards that regulate vehicles model years 2009 through 2016 are termed “Pavley I”; standards for model years 2017 through 2025 were originally termed “Pavley II.”

With these actions, CARB expects that Pavley I will reduce GHG emissions from California passenger vehicles by a total of 31.7 million metric tons of CO_2e counted toward the total pre-economic downturn statewide reduction target on the capped sector of 146.7 million metric tons or CO_2e (CARB, 2008). CARB adopted a second phase of the Pavley regulations, termed “Pavley II,” which are now called the Low Emission Vehicle III Standards. Low Emission Vehicle III covers model years 2017 through 2025. These reductions are to come from improved vehicle technologies such as small engines with superchargers, continuously variable transmissions, and hybrid electric drives.

Advanced Clean Cars Program

In 2012, CARB approved the Advanced Clean Cars Program, a new emissions-control program for noncommercial passenger vehicles and light-duty trucks for model years 2017–2025. The program combines the control of smog, soot, and GHGs with requirements for greater numbers of zero-emission vehicles (ZEVs). By 2025, when the rules will be fully implemented, new automobiles will emit 34 percent fewer GHGs and 75 percent fewer ozone-forming emissions. In its 2014 First Update, CARB recognized that the light-duty vehicle fleet "will need to become largely electrified by 2050 in order to meet California's emission reduction goals". Accordingly, this program requires about 15 percent of new cars sold in California in 2025 to be a plug-in hybrid, battery electric, or fuel cell vehicles (CARB, 2014a).

Executive Orders B-16-2012 and B-48-18 (Zero-Emission Vehicles)

ZEVs include hydrogen fuel cell electric vehicles (EVs) and plug-in EVs, such as battery EVs and plug-in hybrid EVs. In 2012, Governor Brown issued EO B-16-2012, which calls for the increased penetration of ZEVs into California's vehicle fleet to help California achieve a reduction of GHG emissions from the transportation sector equaling 80 percent less than 1990 levels by 2050. The EO also calls upon CARB, the CEC, and the California Public Utilities Commission to establish benchmarks that will: (1) allow over 1.5 million ZEVs to be on California roadways by 2025, and (2) provide the state's residents with easy access to ZEV infrastructure. EO B-16-2012 specifically directed California to "encourage the development and success of ZEVs to protect the environment, stimulate economic growth, and improve the quality of life in the State."

In 2018, Governor Brown also issued EO B-48-18, which launched an 8-year initiative to accelerate the sales of ZEVs through a mix of rebate programs and infrastructure improvements. The EO also sets a new target of five million ZEVs in California by 2030 and includes funding for multiple state agencies to increase EV charging infrastructure and provide purchase rebates and incentives.

In February 2013, the Governor's Interagency Working Group on Zero-emission Vehicles issued the 2013 ZEV Action Plan: A roadmap toward 1.5 million zero-emission vehicles on California roadways by 2025 (Governor's Interagency Working Group, 2013). The 2013 ZEV Action Plan identifies four broad goals for state government to advance ZEVs: (1) complete needed infrastructure and planning, (2) expand consumer awareness and demand, (3) transform fleets, and (4) grow jobs and investment in the private sector.

In October 2016, the Interagency Working Group issued the 2016 ZEV Action Plan: A roadmap toward 1.5 million zero-emission vehicles on California roadways by 2025 (Governor's Interagency Working Group, 2016). This report provided an update on progress toward achieving the 2013 goals and highlighted the following four top priorities for the upcoming years: (1) raise consumer awareness and education about ZEVs; (2) ensure ZEVs are accessible to a broad range of Californians; (3) Make ZEV technologies commercially viable in targeted applications in the medium-duty, heavy-duty, and freight sectors; and (4) aid ZEV market growth beyond California. The broad goals to advance ZEV adoption are: (1) achieve mainstream consumer awareness of ZEV options and benefits, (2) make ZEVs an affordable and attractive option for drivers, (3) ensure convenient charging and fueling infrastructure for greatly expanded use of ZEVs, (4) maximize economic and job opportunities from ZEV technologies, (5) bolster ZEV market growth outside of California, and (6) lead by example by integrating ZEVs into state government.

In September 2018, the Interagency Working Group published the 2018 ZEV Action Plan Priorities Update (Governor's Interagency Working Group, 2018). This update is the result of Governor Brown's directive to update the 2016 Zero-Emission Vehicle Action Plan to help expand private investment in zero-emission vehicle infrastructure, particularly in low income and disadvantaged communities. The 2018 Priorities Update serves three fundamental purposes: (1) provide direction to state agencies on the most important actions to be executed in 2018 to enable progress toward the 2025 targets and 2030 Vision; (2) give stakeholders transparency into the actions state agencies plan to take (or are taking) this year to further the ZEV market; and (3) create a platform for stakeholder engagement, feedback, and collaboration.

Executive Order S-01-07 (Low Carbon Fuel Standard)

This EO established a statewide goal to reduce the carbon intensity of California's transportation fuels by at least 10 percent by 2020 through a low carbon fuel standard (LCFS). CARB adopted the LCFS as a discrete early action measure pursuant to AB 32 in April 2009 and includes it as a reduction measure in its Scoping Plan.

The LCFS is a performance standard with flexible compliance mechanisms intended to incentivize the development of a diverse set of clean, low carbon transportation fuel options. Its aim is to accelerate the availability and diversity of low carbon fuels such as biofuels, electricity, and hydrogen, by taking into consideration the full life cycle of GHG emissions. A 10 percent reduction in the carbon intensity of transportation fuels is expected to equate to a reduction of 16.5 million metric tons of CO_2e in 2020. However, to account for possible overlap of benefits between LCFS and the Pavley GHG standards, CARB has discounted the contribution of LCFS to 15 million metric tons of CO_2e.

California Energy Plan

The CEC is responsible for preparing the State Energy Plan, which identifies emerging trends related to energy supply, demand, conservation, public health and safety, and the maintenance of a healthy economy. The plan calls for the State to assist in the transformation of the transportation system to improve air quality, reduce congestion, and increase the efficient use of fuel supplies with the fewest environmental and energy costs. To further this policy, the plan identifies a number of strategies, including providing assistance to public agencies and fleet operators.

1.3 Regional and Local Regulations

SDAPCD Regulation II: Permits

Regulation II (Rules 10-27.1) contains a series of rules covering permitting requirements within the Subdivision and Development Appeal Board. Rule 20.2 covers new source review for non-major stationary sources (SDAPCD, 2021). If the proposed emissions from a new or modified source or a project involving multiple sources exceed certain thresholds, the rule would require best available control technology and an air quality impact analysis. The air quality impact analysis must demonstrate that such emissions increases will not:

> (1) cause a violation of a national ambient air quality standard anywhere that does not already exceed such standard, nor
>
> (2) cause additional violations of a national ambient air quality standard anywhere the standard is already being exceeded, nor
>
> (3) prevent or interfere with the attainment or maintenance of any national ambient air quality standard.

San Diego Air Pollution Control District Rule 50: Visible Emissions

This rule prohibits the discharge, from any single source of emissions, any air contaminant that aggregates for more than three minutes in any period of 60 consecutive minutes, which is darker in shade than that designated as Number 1 on the Ringelmann Chart, or of such opacity as to obscure an observer's view to a degree greater than does smoke of a shade designated as Number 1 on the Ringelmann Chart (SDAPCD, 2021).

San Diego Air Pollution Control District Rule 51: Nuisance

This rule prohibits the discharge, from any source, of such quantities of air contaminants or other materials that cause or have a tendency to cause injury, detriment, nuisance, and annoyance to people and/or the public, or damage to any business or property (SDAPCD, 2021).

San Diego Air Pollution Control District Rule 55: Fugitive Dust Control

This rule regulates fugitive dust emissions from any commercial construction or demolition activity capable of generating fugitive dust emissions, including active operations, open storage piles, and inactive disturbed areas, as well as track-out and carry-out onto paved roads beyond a project site (SDAPCD, 2021).

San Diego Air Pollution Control District Rule 67.0.1: Architectural Coating

This rule requires manufacturers, distributors, and end users of architectural and industrial maintenance coatings to reduce volatile organic compounds (VOCs) emissions from the use of these coatings, primarily by placing limits on the VOC content of various coating categories (SDAPCD, 2021).

San Diego Air Pollution Control District Rule 67.7: Cutback and Emulsified Asphalts

This rule applies to the application and sale of cutback and emulsified asphalt for paving, construction, or maintenance of parking lots, driveways, streets, and highways. (SDAPCD, 2021).

San Diego Air Pollution Control District Regulation XII (Toxic Air Contaminants)

Regulation XII establishes requirements for several specific source types as well as public notification and emission reduction requirements for stationary sources that emit TACs identified under the California AB 1807 and AB 2588 statutes discussed above. Rule 1210 – Toxic Air Contaminant Public Health Risks – Public Notification and Risk Reduction established an incremental cancer risk public notification threshold of 10 in 1 million and required facility TAC emission reductions if incremental cancer risks exceeded 100 in 1 million. The rule also established a cancer burden risk threshold of 1.0, a total chronic non-cancer health hazard index threshold of 1.0, and a total acute non-cancer health hazard index threshold of 1.0 (SDAPCD, 2021).

Regional Air Quality Strategy

Similar to the federal designations of attainment and nonattainment areas with respect to the NAAQS, CARB designates areas with respect to the CAAQS. Accordingly, CARB has designated San Diego County as a state nonattainment area for ozone, particulate matter less than 10 microns in diameter (PM_{10}), and particulate matter less than 2.5 microns in diameter ($PM_{2.5}$) (CARB, 2021). In compliance with the California CAA, the SDAPCD prepared the 2016 Revision of the Regional Air Quality Strategy for San Diego County to address San Diego County's state nonattainment status for ozone. The Regional Air Quality Strategy identified feasible VOC and NO_x emission control measures for stationary sources, such as industrial operations and manufacturing facilities, to provide expeditious progress toward attaining the state ozone standards. Although the SDAPCD does not have authority to directly regulate mobile sources, the Regional Air Quality Strategy also identified future reductions in mobile source emissions through the SDAPCD's incentive and grant programs. (SDAPCD, 2016b).

City of San Diego Municipal Code

The San Diego Municipal Code addresses air quality and odor impacts at Chapter 14, Article 2, Division 7 paragraph 142.0710, "Air Contaminant Regulations," which states: "Air contaminants including smoke, charred paper, dust, soot, grime, carbon, noxious acids, toxic fumes, gases, odors, and PM, or any emissions that endanger human health, cause damage to vegetation or property, or cause soiling shall not be permitted to emanate beyond the boundaries of the premises upon which the use emitting the contaminants is located".

City of San Diego Green Building Regulations

In response to CalGreen, the City of San Diego adopted its Green Building Regulations (Municipal Code Chapter 14, Article 10), which adopt and incorporate by reference specified provisions of the 2016 CalGreen Code.

City of San Diego Climate Action Plan

In December 2015, the City of San Diego adopted its City of San Diego Climate Action Plan (CAP) (City of San Diego, 2016a). The CAP identifies measures to meet GHG reduction targets for 2020 and 2035. The CAP contains a Citywide 2010 baseline of GHG emissions, BAU projections for emissions at 2020 and 2035, state targets, and potential GHG emission reductions due to the implementation of CAP measures. The CAP identifies GHG reduction strategies for energy- and water-efficient buildings; clean and renewable energy; bicycling, walking, transit, and land use; zero waste; and climate resiliency. To achieve its proportional share of the state reduction targets for 2020 (AB 32) and 2050 (EO S-3-05), the city would need to reduce emissions below the 2010 baseline by 15 percent by 2020, 40 percent by 2030, and 50 percent by 2035. The CAP projects that with the implementation of proposed measures, the city would reduce GHGs by 24 percent by 2020, 41 percent by 2030, and 51 percent by 2035.

In 2016, the city amended the CAP and its CEQA Significance Determination Thresholds to incorporate a CAP Consistency Checklist. This Checklist outlines the process to determine the significance of GHG emissions from proposed development projects that are subject to CEQA review.

City of San Diego General Plan

The City of San Diego General Plan 2008 provides policy guidance to balance the needs of a growing city while enhancing quality of life for residents. The Conservation Element of the General Plan identifies multiple city policies that seek to improve local air quality, reduce GHG emissions, and implement climate change adaptation. Examples of such policies include the overall City of Villages strategy; creating walkable communities that utilize transit, bicycling, and transportation demand management; use of sustainable energy resources; and water resource and waste management. Under the City of Villages strategy, the general plan aims to direct new development projects away from natural undeveloped lands into already urbanized areas and/or areas where conditions allow the integration of housing, employment, civic, and transit uses. (City of San Diego, 2008).

Midway-Pacific Highway Community Plan

The Midway-Pacific Highway Community Plan extends the City of San Diego's General Plan policies within the context of the Midway-Pacific Highway Community Plan Area, which encompasses the project site. The Community Plan supports the City of San Diego CAP by providing capacity for development of residential and employment uses in proximity to transit, and by taking a multi-modal approach to improving circulation and access through and within the community. The Plan's Conservation Element includes policies to reduce the community's impact on air quality and climate change, such as planning for higher-density development in Transit Priority Areas (areas within one-half mile of a major transit stop); supporting regional improvements that promote alternative modes of transportation, such as mobility hubs; providing on-site photovoltaic energy generation and energy storage systems; encouraging energy- and water-efficient building systems; increasing the community's overall tree canopy; and incorporating air pollution-attenuating features into new residential buildings located within 500 feet of a freeway. Section 3.4, *Land Use*, provides a further discussion of the Community Plan. (City of San Diego, 2018a).

San Diego Forward: The Regional Plan

As the Metropolitan Planning Organization for San Diego County, SANDAG is responsible for preparing the RTP. The current RTP for San Diego County is *San Diego Forward: The Regional Plan* (2015 Regional Plan) (SANDAG, 2015). The 2015 Regional Plan includes an advisory plan for transit, rail, and bus services; express or managed lanes; highways; local streets; bicycling; and walking. In accordance with SB 375, the 2015 Regional Plan also includes a SCS. The SCS contains land use, housing, and transportation strategies designed to achieve GHG emission reduction targets for passenger vehicles set by CARB. The current targets are to reduce per-capita passenger vehicle emissions by 15 percent by 2020 and by 21 percent by 2035, compared to 2005 baseline levels. In general, the intent of the SCS is to reduce passenger VMT by locating residents closer to where they work and play and designing communities with easy access to transit services and non-vehicular modes of transportation, which would produce a corresponding reduction in GHG emissions.

SANDAG is currently working on San Diego Forward: The 2021 Regional Plan (2021 Regional Plan), a bigger picture vision which looks beyond the 2050 horizon year to prepare for the next planning cycle. SANDAG anticipates adoption of the 2021 Regional Plan in late 2021.

Additional sources for the above federal, state, regional, and local regulation descriptions include: City of San Diego, 2018b; City of San Diego, 2019; San Diego County Regional Airport Authority, 2019; and San Diego State University, 2020.

2 Emission Quantification Methodology

The air quality analysis used California Emissions Estimator Model (CalEEMod) version 2016.3.2 to quantify criteria pollutant and GHG emissions for Old Town Campus (OTC) existing conditions and the project alternatives. CalEEMod is a statewide program designed to calculate criteria pollutant and GHG emissions from land use development projects in California. It was designed to be used for a variety of situations where an air quality analysis is necessary or desirable such as preparing CEQA or National Environmental Policy Act (NEPA) documents, conducting pre-project planning, and verifying compliance with local air quality rules and regulations (California Air Pollution Control Officers Association [CAPCOA], 2016).

CalEEMod uses widely accepted emission calculation methods combined with default data that can be used if site-specific information is not available. The CalEEMod User's Guide and associated appendices describe the specific methodologies used by CalEEMod in detail (CAPCOA, 2017). This appendix provides the methodology used to prepare the CalEEMod inputs. Attachment 2 includes the CalEEMod input and output files that document the specifics of the analysis.

CalEEMod reports GHGs individually and as CO_2e. To obtain the CO_2e, each GHG is multiplied by its GWP and the products are summed over all GHGs. The GWP designates on a pound-for-pound basis the potency of the GHG compared to CO_2. The program uses GWPs from the 2007 IPCC Fourth Assessment Report (IPCC, 2007), which are consistent with CARB's 2014 Scoping Plan Update (CARB, 2014a).

This appendix also describes the methodology for speciating the criteria pollutant emissions into their HAP components.

2.1 Construction Methodology

CalEEMod calculated direct construction emissions for the following sources:

- On-site construction equipment (engine exhaust)
- Vehicle trips to and from the site associated with workers, vendors, and hauling (engine exhaust; particulates from tire wear, brake wear, and road dust)
- On-site fugitive dust associated with grading, demolition, and truck loading
- Architectural coating activities (evaporative VOC emissions from painting buildings and parking lots)
- On-site paving (off-gassing VOC emissions from laying asphalt)

To assess NEPA impacts (see Section 3.1) and CEQA impacts (see Appendix A), this analysis included all construction emissions associated with the sources identified in the preceding bullets. For general conformity, this analysis included only the direct and indirect construction-related emissions from sources that would be practicably controllable and over which the Navy would have continuing program responsibility. Specifically, the general conformity analysis (see Section 3.1.5.2) included construction emissions associated with (1) all on-site sources, and (2) outbound one-way trips for trucks hauling debris or soil off-site. The general conformity analysis excluded off-site emissions associated with construction worker trips, vendor trips, and inbound empty haul truck trips because they would not be practicably controllable by the Navy.

The following methodology describes the key assumptions used in estimating construction emissions for the project alternatives. Project-specific data were used where available. Where project-specific data were lacking, this analysis used a combination of CalEEMod default data for San Diego County and conservative assumptions. Default data were used for portions of the CalEEMod input not specifically discussed below.

2.1.1 Construction Elements

Table D-2 shows the building floor space and paved surface area proposed for construction by each project alternative, based on CalEEMod land use categories. CalEEMod used these values to estimate the default number of on-road vehicle trips during the building construction phase and the quantity of architectural coatings applied to the constructed buildings and parking lots.

Table D-2 Building Floor Space and Paved Surface Area Proposed for Construction, by CalEEMod Land Use Category (square feet)

Development Type/CalEEMod Land Use Category	*Alternative 1(1)*	*Alternative 2*	*Alternative 3*	*Alternative 4*	*Alternative 5*
Navy Development	-	-	-	-	-
Government Office Building(2)	1,045,520	874,482	874,482	874,482	874,482
Research & Development	174,865	165,614	165,614	165,614	165,614
Unrefrigerated Warehouse	345,941	24,172	24,172	24,172	24,172
Other Asphalt Surfaces(3)	439,506	57,495	57,495	57,495	57,495
Parking Lot (Asphalt)	1,001,502	0	0	0	0
Unenclosed Parking Structure with Elevator	0	630,000	630,000	630,000	630,000
Private Development	**-**	**-**	**-**	**-**	**-**
Apartments Mid-Rise(4)	0	2,880,000	2,304,000	2,880,000	2,880,000
Apartments High-Rise(5)	0	3,456,000	1,920,000	6,720,000	4,800,000
General Office Building	0	1,000,000	650,000	1,350,000	850,000
Hotel	0	260,000	160,000	290,000	290,000
Retail - Strip Mall	0	180,000	130,000	250,000	200,000
Government (Civic Center) (Transit Center)	0	0	0	140,000	140,000
Parking Lot (Asphalt) (Transit Center)	0	0	0	175,000	175,000
Unenclosed Parking Structure with Elevator	0	4,123,700	2,741,900	6,090,000	4,782,750
Other Asphalt Surfaces(3)	0	989,455	1,243,071	786,516	950,182

Legend: - = no data in cell.

Notes: (1) The values shown for Alternative 1 represent the construction that would occur at OTC Site 1. The land uses at OTC Site 2 would remain unmodified under Alternative 1 and therefore are not included in the table.
(2) Includes conference/auditorium space.
(3) Other Asphalt Surfaces include areas such as streets and open storage.
(4) Defined in the CalEEMod Guidance as 3-10 levels.
(5) Defined in the CalEEMod Guidance as >10 levels.

Table D-3 shows the modeled acreages of disturbed land during construction by CalEEMod land use category. CalEEMod used these values to estimate the default construction phase durations, construction equipment counts, and amount of required grading.

Table D-3 Disturbed Land Areas by CalEEMod Land Use Category (acres)

Development Type/CalEEMod Land Use Category[(1)]	*Alternative 1*[(2)]	*Alternative 2*	*Alternative 3*	*Alternative 4*	*Alternative 5*
Navy Development	-	-	-	-	-
Government Office Building[(3)]	4.46	2.18	2.18	2.18	2.18
Research & Development[(3)]	4.46	2.18	2.18	2.18	2.18
Unrefrigerated Warehouse[(3)]	4.46	0.55	0.55	0.55	0.55
Other Asphalt Surfaces	10.09	1.32	1.32	1.32	1.32
Parking Lot (Asphalt)	22.99	0	0	0	0
Unenclosed Parking Structure with Elevator	0	1.81	1.81	1.81	1.81
Subtotal	**46.4**	**8.0**	**8.0**	**8.0**	**8.0**
Private Development	-	-	-	-	-
Apartments Mid-Rise	0	12.5	11.46	9.18	10.19
Apartments High-Rise	0	15	9.55	21.42	16.99
General Office Building	0	4.34	3.23	4.3	3.01
Hotel	0	1.13	0.8	0.92	1.03
Retail - Strip Mall[(4)]	0	0	0	0	0
Government (Civic Center) (Transit Center)	0	0	0	2.06	3.13
Parking Lot (Asphalt) (Transit Center)	0	0	0	2.06	3.13
Unenclosed Parking Structure with Elevator[(5)]	0	6.31	8.43	3.99	2.68
Other Asphalt Surfaces (streets)	0	22.71	28.54	18.06	21.81
Subtotal	**0**	**62.0**	**62.0**	**62.0**	**62.0**
Total	**46.4**	**70.0**	**70.0**	**70.0**	**70.0**

Legend = - no data in cell.

Notes: [(1)] Landscaped green space is included in the acreages for the commercial and residential buildings.

[(2)] The total disturbed acreage for Alternative 1 (46.4 acres) is smaller than the other alternatives (70.0 acres) because construction for Alternative 1 would occur only on OTC Site 1, whereas construction for Alternatives 2 through 5 would occur on both OTC Site 1 and OTC Site 2.

[(3)] The disturbed acres for the government office building, research & development, and unrefrigerated warehouse land uses in Alternative 1 (totaling 13.4 acres) would be for refurbishment of existing buildings, so there would be no grading on those acres.

[(4)] To avoid double counting land areas, the value for retail was set to zero because retail would share space with the commercial and residential buildings.

[(5)] To avoid double counting land areas, only acreages for standalone parking structures were included in this category. The acreages assigned to commercial and residential buildings account for parking structures at the base of those buildings.

Source: M. Carpenter, KTU+A, personal communication, April 13, 2020.

Table D-4 presents the number of new parking stalls that would be constructed for the project alternatives. CalEEMod used this data to estimate the quantity of architectural coatings applied for the parking lot striping.

Table D-4 New Parking Stalls Constructed, by CalEEMod Land Use Category (# stalls)

Development Type/CalEEMod Land Use Category	*Alternative 1*	*Alternative 2*	*Alternative 3*	*Alternative 4*	*Alternative 5*
Navy Development	-	-	-	-	-
Multi-story concrete structure	0	2,000	2,000	2,000	2,000
Asphalt Lot	3,180[(1)]	0	0	0	0
Private Development	-	-	-	-	-
Multi-story concrete structure	0	11,782	7,834	17,400	13,665
Asphalt Lot (Transit Center)	0	0	0	500	500

Legend = - no data in cell.

Note: [(1)] This value represents the number of new parking spaces constructed on OTC Site 1 for Alternative 1. There would be 1,361 existing parking spaces on OTC Site 2 that would remain unmodified, bringing the total number of existing and new parking spaces to 4,541.

Source: M. Carpenter, KTU+A, personal communication, April 13, 2020.

2.1.2 Construction Schedule

This analysis assumed the following general construction timeline:

- Navy development would be constructed from 2021 through 2025 for all action alternatives (Alternatives 1 through 5).
- Private development would be constructed from 2026 through 2049 for Alternatives 2 through 5. There would be no private development for Alternative 1.
- The transit center would be constructed from 2026 through 2034 for Alternatives 4 and 5. There would be no transit center constructed for Alternatives 1, 2, or 3.
- There would be no construction for the No Action Alternative and existing conditions.

For the action alternatives, CalEEMod quantified emissions for the following construction phases:

- Demolition – involves removing buildings or structures.
- Site Preparation – involves clearing vegetation (grubbing and tree/stump removal) and removing stones and other unwanted material or debris prior to grading.
- Grading – involves the cut and fill of land to ensure that the proper base and slope is created for the foundation. For Alternatives 2 through 5, additional equipment was manually added to this phase to model underground utility installation together with grading.
- Foundation Drilling – involves the installation of caissons or piles to support building foundations.
- Building Construction – involves the construction of the foundation, structures, and buildings.
- Architectural Coating – involves the application of coatings to both the interior and exterior of buildings or structures, the painting of parking lot or parking garage striping, associated signage and curbs, and the painting of the walls or other components such as stair railings inside parking structures.

- Paving – involves the laying of concrete or asphalt such as in parking lots, roads, driveways, or sidewalks.

Each of the phases listed above is a default phase in CalEEMod except foundation drilling, which was manually added to CalEEMod. At the time of this analysis, the preliminary conceptual drawings of the action alternatives provided counts for proposed new buildings having nine floors or greater. Therefore, this analysis assumed that foundation drilling would occur for each constructed building or parking structure having nine floors or greater. The drilling phase duration was assumed to be 10 work days per structure. Because Alternative 1 would have no structures nine floors or greater, only Alternatives 2 through 5 would have foundation drilling. This analysis assumed the following structure counts for foundation drilling, based on the preliminary conceptual drawings:

- Alternatives 2-5, Navy Development: 4 structures with 9+ floors
- Alternative 2, Private Development: 57 structures with 9+ floors
- Alternative 3, Private Development: 48 structures with 9+ floors
- Alternative 4, Private Development: 84 structures with 9+ floors
- Alternative 5, Private Development: 88 structures with 9+ floors

Tables D-5 through D-10 present the construction schedules modeled in CalEEMod. The tables are organized by alternative and by Navy Development versus Private Development. Except where noted, the construction schedules use the CalEEMod defaults for phase order and duration. CalEEMod determined phase duration from the total disturbed land areas for Navy Development and Private Development in Table D-3. The disturbed land areas are 46.4 acres for Alternative 1 Navy Development, 8.0 acres for Alternatives 2 through 5 Navy Development, and 62.0 acres for Alternatives 2 through 5 Private Development.

Because the exact construction schedules have not yet been defined for the action alternatives, the modeled schedules are conceptual and are not intended to commit an action alternative to any particular order or timing of phases. Their purpose is to provide reasonable construction scenarios suitable for evaluating potential air quality and GHG impacts. In practice, the construction phases may have multiple starts and stops within each construction period as construction activities shift from parcel to parcel. For simplicity, each phase was modeled in CalEEMod as a continuous event, while preserving the predicted total and maximum daily activity levels.

Any delay to the start of construction, which this analysis assumed would be January 1, 2021, would not result in emissions greater than those estimated in this analysis. Emissions from on-site sources would be approximately unchanged. Emissions associated with worker, vendor, and truck haul trips could be lower with a delayed construction start year due to future fleet turnover where older vehicles are gradually retired and replaced with newer vehicles meeting cleaner emission standards.

As shown in Tables D-7 through D-10, the modeled construction phases for Private Development were manually re-started to coincide with each intermediate operational analysis year (2026, 2030, and 2035). This modeling approach made it possible to estimate overlapping construction and operational emissions in each operational analysis year while accounting for the declining temporal trend in vehicle emissions due to future fleet turnover. The total numbers of work days for the grading, foundation drilling, paving, and architectural coating phases in CalEEMod were apportioned 25 percent to years 2026-2029, 20 percent to 2030-2034, and 55 percent to 2035-2049. This apportionment is consistent with the assumption that Private Development would be 25 percent operational by 2030, 45 percent operational by 2035, and 100 percent operational by 2050.

Table D-5 Construction Schedule Modeled in CalEEMod for Alternative 1

Phase Name	*Start Date*	*End Date*	*Work Days Per Week*	*Total Work Days*
Demolition	1/1/2021	3/11/2021	5	50
Site Preparation[1]	3/12/2021	4/8/2021	5	20
Grading[1]	4/9/2021	6/10/2021	5	45
Building Construction	6/11/2021	7/30/2025	5	1,079
Paving	7/31/2025	10/15/2025	5	55
Architectural Coating	10/16/2025	12/31/2025	5	55

Notes: [1] Total work days for site preparation and grading reflect an equivalent 33-acre site to account for no such activity on 13.4 acres of the 46.4-acre site where existing building refurbishment would occur.

Table D-6 Construction Schedule Modeled in CalEEMod for Alternatives 2 through 5, Navy Development

Phase Name	*Start Date*	*End Date*	*Work Days Per Week*	*Total Work Days*
Demolition[1]	1/1/2021	1/28/2021	5	20
Site Preparation	1/29/2021	2/11/2021	5	10
Grading and Utilities	2/12/2021	3/11/2021	5	20
Foundation Drilling	2/12/2021	4/8/2021	5	40
Building Construction	3/12/2021	11/5/2025	5	1,214
Paving	11/6/2025	12/3/2025	5	20
Architectural Coating	12/4/2025	12/31/2025	5	20

Notes: [1] Depending on the selected location within the OTC, construction of the Navy Development for Alternatives 2 through 5 may not require demolition of existing structures. However, to be conservative, the analysis assumed demolition would occur.

Table D-7 Construction Schedule Modeled in CalEEMod for Alternative 2, Private Development

Years/Phase Name	*Start Date*	*End Date*	*Work Days Per Week*	*Total Work Days*(1)
2026-2029	-	-	-	-

2035-2049	-	-	-	-
Grading and Utilities	1/1/2035	3/26/2035	5	61
Foundation Drilling	1/1/2035	10/7/2036	5	462
Building Construction	3/27/2035	9/8/2049	5	3,772
Paving	9/9/2049	11/4/2049	5	41
Architectural Coating	11/5/2049	12/31/2049	5	41

Legend: - = no data in cell.

Notes: (1) The total number of work days for the grading, foundation drilling, paving, and architectural coating phases in CalEEMod were apportioned 25 percent to years 2026-2029, 20 percent to 2030-2034, and 55 percent to 2035-2049.

(2) All demolition and site preparation were assumed to occur in the 2026-2029 period.

Table D-10 Construction Schedule Modeled in CalEEMod for Alternative 5, Private Development

Years/Phase Name	*Start Date*	*End Date*	*Work Days Per Week*	*Total Work Days*[1]
2026-2029	-	-	-	-
Demolition[2]	1/1/2026	4/8/2026	5	70
Site Preparation[2]	4/9/2026	6/3/2026	5	40
Grading and Utilities	6/4/2026	7/13/2026	5	28
Foundation Drilling	6/4/2026	4/7/2027	5	220
Building Construction	7/14/2026	11/7/2029	5	867
Paving	11/8/2029	12/4/2029	5	19
Architectural Coating	12/5/2029	12/31/2029	5	19
2030-2034	-	-	-	-
Grading and Utilities	1/1/2030	1/30/2030	5	22
Foundation Drilling	1/1/2030	9/3/2030	5	176
Building Construction	1/31/2030	11/17/2034	5	1,252
Paving	11/18/2034	12/8/2034	5	15
Architectural Coating	12/9/2034	12/31/2034	5	15
2035-2049	-	-	-	-
Grading and Utilities	1/1/2035	3/26/2035	5	61
Foundation Drilling	1/1/2035	11/6/2036	5	484
Building Construction	3/27/2035	9/8/2049	5	3,772
Paving	9/9/2049	11/4/2049	5	41
Architectural Coating	11/5/2049	12/31/2049	5	41

Legend: - = no data in cell.

Notes: (1) The total number of work days for the grading, foundation drilling, paving, and architectural coating phases in CalEEMod were apportioned 25 percent to years 2026-2029, 20 percent to 2030-2034, and 55 percent to 2035-2049.

(2) All demolition and site preparation were assumed to occur in the 2026-2029 period.

During each Navy Development and Private Development construction sequence (2021-2025, 2026-2029, 2030-2034, and 2035-2049), the building construction phase duration was manually adjusted to exactly fill up the construction time period. The quantity of equipment used during the building construction phase was also adjusted to reflect the phase duration and the amount of floor space to be constructed.

2.1.3 Construction Equipment

Table D-11 lists the construction equipment counts modeled in CalEEMod for each alternative. The analysis used CalEEMod defaults for equipment counts, daily operating hours, horsepower ratings, and load factors except where noted. The most notable exception is the equipment counts used for the building construction and architectural coating phases. The CalEEMod default equipment counts for those two phases are relatively low, indicative of a single building construction event. Specifically, the default equipment count for building construction is one crane, three forklifts, three tractors/loaders/ backhoes, one welder, and one generator set. The default equipment count for architectural coating is one air compressor. By contrast, the rate of construction necessary for the action alternatives would require the simultaneous use of multiple equipment sets.

Table D-11 Construction Equipment Counts Modeled in CalEEMod (# units)

Phase/Construction Equipment[1]	*Alternative 1 Navy*	*Alternatives 2-5 Navy*	*Alternative 2 Private*	*Alternative 3 Private*	*Alternative 4 Private*	*Alternative 5 Private*
Demolition	-	-	-	-	-	-
Concrete/Industrial Saws	1	1	1	1	1	1
Excavators	3	3	3	3	3	3
Rubber Tired Dozers	2	2	2	2	2	2
Site Preparation	-	-	-	-	-	-
Rubber Tired Dozers	3	3	3	3	3	3
Tractors/Loaders/Backhoes	4	4	4	4	4	4
Grading and Utilities[2]	[3]	-	-	-	-	-
Excavators	2	1	2	2	2	2
Forklifts	0	1	1	1	1	1
Graders	1	1	1	1	1	1
Off-Highway Trucks	0	2	2	2	2	2
Other Material Handling Equipment	0	1	1	1	1	1
Rubber Tired Dozers	1	1	1	1	1	1
Scrapers	2	0	2	2	2	2
Tractors/Loaders/Backhoes	2	4	3	3	3	3
Trenchers	0	1	1	1	1	1
Foundation Drilling[4]	[5]	-	-	-	-	-
Bore/Drill Rigs	0	1	1	1	1	1
Cranes	0	2	2	2	2	2
Building Construction[6]	-	-	-	-	-	-
Cranes	2	4	6	4	9	7
Forklifts	6	12	18	12	27	21
Generator Sets	2	4	6	4	9	7
Tractors/Loaders/Backhoes	6	12	18	12	27	21
Welders	2	4	6	4	9	7
Paving	-	-	-	-	-	-
Pavers	2	2	2	2	2	2
Paving Equipment	2	2	2	2	2	2
Rollers	2	2	2	2	2	2
Architectural Coating[6]	-	-	-	-	-	-
Air Compressors	4	4	6	4	9	7

Notes: [1] Except where noted, equipment counts are CalEEMod defaults based on total disturbed land area for the Navy or Private Development.

[2] The following equipment was manually added to the grading phase for Alternatives 2-5 to account for underground utility installation: one forklift, two off-highway trucks, one other material handling equipment, one tractor/loader/backhoe, and one trencher. Typical utility installation equipment counts were obtained from the *Valiano Project Draft Final Environmental Impact Report* (County of San Diego, 2018). The utility installation equipment was assumed to operate 8 hours per day. CalEEMod default horsepower ratings were used.

[3] As stated in Section 3.11, construction of Alternative 1 would not require substantial ground disturbance related to utility installation. Therefore, the equipment list for Alternative 1 is exclusively for grading.

[4] Ten work days of foundation drilling were assumed for each structure with nine floors or greater. Typical drilling equipment counts were obtained from the *Terminal Island (Pier 400) Railyard Enhancement Project Final IS/MND* (Los Angeles Harbor Department, 2018). All equipment was assumed to operate 8 hours per day. CalEEMod default horsepower ratings were used for the cranes. An average rating of 500 horsepower was assigned to the drill rig based on online research (Pile Buck, 2018).

[5] Alternative 1 would not construct any buildings with nine floors or greater; therefore, no foundation drilling was modeled.

[6] For the building construction and architectural coating phases, the default equipment counts were multiplied by the estimated number of simultaneous equipment sets shown in Tables D-12 and D-13. The adjusted equipment counts are displayed in the table.

Table D-12 presents the number of simultaneous equipment sets assumed for the building construction and architectural coating phases for Private Development construction (2026-2049). The computations assume that one equipment set would be needed to construct approximately 80,000 square feet of building floor space in one year (80,000 square feet is the smallest average building size of any alternative). Accordingly, the number of simultaneous equipment sets needed for each alternative was determined by that alternative's total floor space to be constructed over the 24-year period. The estimated number of simultaneous equipment sets was multiplied by the CalEEMod default equipment counts for the building construction and architectural coating phases to produce the adjusted equipment counts shown in Table D-11.

Table D-12 Number of Simultaneous Equipment Sets Estimated for Building Construction and Architectural Coating for Private Development

Alternative	*Total # of Private Development Buildings to be Constructed[1]*	*Total Years of Private Development Construction*	*Average # of Buildings Completed per Year*	*Average Building Floor Space (square feet)[2]*	*Average Construction Time per Building (years)[3]*	*# of Simultaneous Equipment Sets[4]*
Alternative 2	84	24	3.5	141,663	1.8	6
Alternative 3	99	24	4.1	79,858	1.0	4
Alternative 4	102	24	4.3	173,725	2.2	9
Alternative 5	100	24	4.2	139,428	1.7	7

Notes: [1] Sum of buildings and parking structures from the preliminary conceptual drawings of the alternatives available at the time of this analysis, minus seven Navy development buildings.
[2] Equals (Land Use Square Feet + Parking Structure Square Feet)/# of Buildings Constructed. Land Use Square Feet is from Table D-2, Private Development, excluding asphalt parking lots and other asphalt surfaces.
[3] Estimated construction time per building is assumed to be one year for Alternative 3 (smallest average building floor space). Other alternatives were scaled up by average building floor space.
[4] Rounded to the nearest whole number, as these estimates are approximate.

Table D-13 presents the number of simultaneous equipment sets assumed for the building construction and architectural coating phases for Navy Development construction (2021-2025). The estimates are based on the same approach used for private development. The estimated number of simultaneous equipment sets was multiplied by the CalEEMod default equipment counts for the building construction and architectural coating phases to produce the adjusted equipment counts shown in Table D-11.

Table D-13 Number of Simultaneous Equipment Sets Estimated for Building Construction and Architectural Coating for Navy Development

Alternative	*Total Building Floor Space Constructed (square feet)*[(1)]	*Amount of Construction Needed (equipment set-years)*[(2)]	*Available Years of Construction (years)*	*# of Simultaneous Equipment Sets for Building Construction*[(3)]	*# of Simultaneous Equipment Sets for Architectural Coating*[(3)]
Alternative 1 Navy Development	1,566,326	20	5	2[(4)]	4
Alternatives 2-5 Navy Development	1,694,268	21	5	4	4

Notes: [(1)] From Table D-2, Navy Development, excluding asphalt parking lots and other asphalt surfaces.
[(2)] Scaled from the building construction equipment set assumptions for Private Development (Table D-12): one equipment set-year for every 80,000 square feet constructed. An equipment set-year is the equivalent of one equipment set operating for one year.
[(3)] Rounded to the nearest whole number, as these estimates are approximate.
[(4)] For the Alternative 1 building construction phase, this analysis assumed the effective square feet is one-half the actual square feet because construction would consist primarily of existing building refurbishment rather than new building construction.

As a construction management practice, all off-road diesel-powered construction equipment greater than 50 horsepower would meet USEPA Nonroad Final Tier 4 emission standards. Although CalEEMod modeled this reduction as a mitigation measure, it was treated as a project element in this analysis. This measure is identified as proposed Management Practice AQ MGMT-3 in Draft Environmental Impact Statement (EIS) Section 3.1.

2.1.4 Soil Export and Haul Trips

Table D-14 presents the estimated quantity of soil to be exported off-site during the grading phase of construction. The Draft EIS land use study provided the soil export quantities. The table also presents the number of truck trips needed to haul the soil off-site. CalEEMod estimated off-site soil haul truck trips by assuming each truck would carry 16 cubic yards. CalEEMod default trip lengths were used to calculate VMT. The displayed soil and trip quantities for Private Development were apportioned in CalEEMod 25 percent to years 2026-2029, 20 percent to 2030-2034, and 55 percent to 2035-2049.

Table D-14 Net Soil Export and Associated Haul Trips Modeled in CalEEMod

Alternative	*Net Soil Export (cubic yards)*	*Total Haul Trips[(1)]*
Navy Development	-	-
Alternative 1	113,000	14,125
Alternatives 2 through 5[(2)]	60,000	7,500
Private Development[(2)(3)]	-	-
Alternative 2	490,000	61,250
Alternative 3	490,000	61,250
Alternative 4	460,000	57,500
Alternative 5	400,000	50,000

Legend: - = no data in cell.

Notes: (1) CalEEMod estimated the haul trips by assuming a default truck capacity of 16 cubic yards.
(2) For Alternatives 2 through 5, the soil export quantities assigned to the Navy Development and Private Development were scaled from the total export quantity in proportion to their relative land acreages (approximately 11 percent for Navy Development and 89 percent for Private Development).
(3) The soil export quantities for Private Development modeled in CalEEMod were apportioned 25 percent to years 2026-2029, 20 percent to 2030-2034, and 55 percent to 2035-2049.

Source: M. Carpenter, KTU+A, personal communication, April 13, 2020.

2.1.5 Demolition and Haul Trips

Table D-15 provides the estimated quantity of demolition debris and the associated truck haul trips for each build alternative. The debris quantities were obtained from the hazardous materials study (Draft EIS Section 3.7). CalEEMod used the quantities to estimate the generation of fugitive dust emissions and the number of truck haul trips needed to remove the debris from OTC. CalEEMod default trip lengths were used to calculate VMT.

Table D-15 Demolition Debris and Associated Haul Trips Modeled in CalEEMod

Alternative	*Demolition Debris Hauled Off-Site (tons)*	*Total Haul Trips[(1)]*
Alternative 1 Navy Development	24,490	2,422
Alternatives 2-5 Navy Development[(2)]	18,854	1,864
Alternatives 2-5 Private Development[(3)]	152,546	15,084

Notes: (1) Total haul trips were estimated by CalEEMod using default truck capacity assumptions.
(2) Depending on the selected location within OTC, construction of the Navy Development for Alternatives 2 through 5 might not require demolition of existing structures. However, to be conservative, the analysis assumed demolition would occur during Navy development construction. The total estimated demolition debris (171,400 tons) was apportioned to the Navy Development and Private Development in proportion to their respective land acreages (11 percent to Navy Development and 89 percent to Private Development).
(3) For Private Development, all demolition was assumed to occur in the 2026-2029 construction period.

Source: Hazardous materials study (Draft EIS Section 3.7).

2.1.6 Construction Worker Trips

Table D-16 shows the number of daily worker trips modeled in CalEEMod for the building construction phase. These quantities were derived from estimates of the number of on-site construction workers provided by the Draft EIS socioeconomics study. Architectural coating worker trips were also modified in CalEEMod to equal 20 percent of the building construction phase trips, in accordance with the

CalEEMod User Guide. CalEEMod used the default numbers of worker trips for the demolition, site preparation, grading, and paving phases based on the number of construction equipment. For the foundation drilling phase, an estimate of 20 worker trips per day was used (Los Angeles Harbor Department, 2018). CalEEMod used default worker trip lengths to calculate VMT.

Table D-16 Daily Construction Worker Trips During the Building Construction Phase (trips/day)

Development Type/Alternative(1)	*Years 2021-2025*	*Years 2026-2029*	*Years 2030-2034*	*Years 2035-2049*
Navy Development	-	-	-	-
Alternative 1	662	0	0	0
Alternatives 2-5	2,234	0	0	0
Private Development	-	-	-	-
Alternative 2	0	946	946	946
Alternative 3	0	628	628	628
Alternative 4	0	3,326	3,326	1,392
Alternative 5	0	3,026	3,026	1,090

Legend: - = no data in cell.

Notes: (1) In accordance with the CalEEMod User Guide, the number of daily trips was assumed to be 2 times the number of daily on-site construction workers.

Source: Draft EIS socioeconomics study (D. Kiernan, personal communication, March 13, 2020).

2.1.7 Construction Vendor Trips

Table D-17 presents the number of daily vendor trips (concrete trucks, water trucks, building material delivery trucks, etc.) modeled in CalEEMod during the building construction phase. CalEEMod used default assumptions to estimate the total number of vendor trips. The daily number of vendor trips was manually adjusted to preserve the total default number of vendor trips while accounting for the modified building construction phase lengths listed in Tables D-5 through D-10. For the foundation drilling phase, an estimate of 16 vendor trips per day was used (Los Angeles Harbor Department, 2018). CalEEMod used default vender trip lengths to calculate VMT.

Table D-17 Daily Vendor Trips During the Building Construction Phase

Alternative	*Default Daily Vendor Trips(1)*	*Default Building Construction Length (days)(1)*	*Revised Building Construction Length (days)(2)*	*Revised Daily Vendor Trips(3)*
Navy Development	-	-	-	-
Alternative 1	493	740	1,079	338
Alternatives 2-5	287	230	1,214	54
Private Development	-	-	-	-
Alternative 2	1,780	1,110	5,891	335
Alternative 3	1,278	1,110	5,891	241
Alternative 4	2,557	1,110	5,891	482
Alternative 5	2,066	1,110	5,891	389

Legend: - = no data in cell.

Notes: (1) Default values were estimated by CalEEMod.
(2) From Tables D-5 through D-10.
(3) Revised vendor trips = default trips × default work days / revised work days.

2.1.8 Fugitive Dust

CalEEMod default assumptions were used in the calculation of fugitive dust emissions from grading, demolition, truck loading, and paved road dust. This analysis assumed that on-site disturbed land areas would be watered two times per day, per SDAPCD Rule 55. Accordingly, CalEEMod applied a 55 percent reduction to PM_{10} and $PM_{2.5}$ fugitive dust emissions from on-site earth disturbance. Although CalEEMod labels this reduction as a mitigation measure, it was treated as a project element in this analysis. This measure is part of proposed Management Practice AQ MGMT-1 in Draft EIS Section 3.1.

2.1.9 Architectural Coating

CalEEMod estimated the default areas of interior and exterior building surfaces and asphalt surfaces to be painted during construction, based on the land use sizes shown in Table D-2. For Private Development, the default quantities in CalEEMod were manually apportioned 25 percent to years 2026-2029, 20 percent to 2030-2034, and 55 percent to 2035-2049. The calculations assumed an architectural coating VOC limit of 50 grams per liter for interior (flat) coatings and 100 grams per liter for exterior (non-flat) and pavement coatings to reflect the requirements of SDAPCD Rule 67.0.1.

As an artifact of the construction schedules in Tables D-7 through D-10, CalEEMod assigned all architectural coating emissions during Private Development construction to years 2029, 2034, and 2049. In practice, the application of coatings would occur relatively evenly over the construction period as the structures are completed. Therefore, the annual architectural coating emissions of reactive organic gases (ROG) predicted by CalEEMod for Private Development were manually distributed evenly across the years 2028 through 2049 (2028 being the year the first private development structure would be completed, as predicted by CalEEMod). This analysis assumed that ROG is equivalent to VOC.

Furthermore, CalEEMod assumed as a default that all architectural coating activities over the entire 5-year construction period for the Navy development would occur on only 20 work days. For private development, CalEEMod assumed all architectural coating activities over the entire 24-year construction period would occur on only 75 work days. These relatively few work days resulted in unrealistically high estimates of maximum daily VOC emissions for Alternatives 4 and 5 in the CEQA analysis. Nevertheless, because this analysis did not have any project-specific work day assumptions to use in lieu of the CalEEMod defaults, the defaults were retained in the analysis for the unmitigated maximum daily emission estimates. These assumptions did not affect the NEPA analysis because the NEPA analysis only required estimates of annual emissions.

The default number of architectural coating work days assumed by CalEEMod is based on the number of acres developed rather than the building floor space constructed. For high-density development projects like Alternatives 4 and 5, where there is a high ratio of building floor space to acres, the CalEEMod default number of work days is unrealistically low. Therefore, this analysis developed a mitigation measure for the CEQA analysis (categorized as a management practice for NEPA analysis) to limit the daily amount of coating application such that the maximum daily construction VOC emissions would remain less than significant under CEQA. This approach resulted in a daily limit of 119 pounds per day for VOCs in applied architectural coatings. This measure would effectively spread out the architectural coating activities over a much greater number of work days (a minimum of 54 Navy development work days and 751 private development work days). The measure is described in Section 3.1.12 of this appendix and in Appendix A (CEQA analysis).

2.1.10 On-Road Vehicle Emission Factors

CalEEMod 2016.3.2 used built-in emission factors from EMission FACtor (EMFAC) 2014 to quantify emissions from on-road vehicles. EMFAC2014 is a CARB emissions inventory model that calculates emissions inventories for motor vehicles operating on roads in California. CARB developed EMFAC2014 to support its regulatory and air quality planning efforts and to meet the Federal Highway Administration's transportation planning requirements (CARB, 2014b). EMFAC2014 was the USEPA-approved on-road vehicle emissions model for California at the time CAPCOA released CalEEMod 2016.3.2 in November 2017.

EMFAC2014 accounts for the GHG-reducing effects from the implementation of Pavley I (Clean Car Standards) and the LCFS. The EMFAC2014 emission factors generally decline over time due to the effects of existing regulations and vehicle fleet turnover. In CalEEMod, the analysis selected EMFAC2014 emission factors representative of San Diego County vehicle fleet characteristics.

CARB released its next version of EMFAC, EMFAC2017, in December 2018. EMFAC2017 included updated emission factors and data on car and truck activities, and emissions reductions associated with new regulations affecting heavy heavy-duty diesel trucks and buses. USEPA-approved EMFAC2017 for SIP and conformity purposes on August 15, 2019. The general conformity regulation (Section 93.159) states that "a grace period of 3 months shall apply during which the motor vehicle emissions model previously specified by USEPA as the most current version may be used unless USEPA announces a longer grace period in the Federal Register."

At the time of this analysis, CalEEMod 2016.3.2, with EMFAC2014 vehicle emission factors, was the current land use emissions estimation model suitable for projects of the size and complexity of the proposed action and alternatives. In February 2021, the South Coast Air Quality Management District provided a beta version of CalEEMod 2020, with EMFAC2017 vehicle emission factors, to a select group of users to test and trouble-shoot the model. However, as of March 2021, CalEEMod 2020 had not yet been finalized or made available for public use. Therefore, for transparency and simplicity of analysis, the Navy elected to use CalEEMod 2016.3.2, which was the best publicly available comprehensive emissions quantification tool available at the time of analysis.

The 2019 SAFE Vehicles Rule revoked California's authority to set its own greenhouse gas emission standards and zero-emission vehicle mandates. This rule would result in higher emissions of certain criteria pollutants and CO_2 from light-duty gasoline vehicles than what was estimated by EMFAC2014. To incorporate the effects of the SAFE Vehicles Rule, CARB published adjustment factors for criteria pollutants in 2019 and for CO_2 in 2020 (CARB, 2019b; CARB, 2020c). These factors are shown in Table D-18. This analysis applied the criteria pollutant adjustment factors to the CalEEMod emission estimates. However, because the quantitative analysis was already complete by the time CARB published the CO_2 adjustment factors, the CO_2e emissions in this analysis do not include the adjustment factors. The adjustment factors would have increased estimated CO_2 emissions from light-duty gasoline vehicles by 5.7 percent in 2026, 9.7 percent in 2030, 13.6 percent in 2035, and 16.7 percent in 2050. This adjustment would not have affected the significance findings of the Draft EIS or Appendix A because the GHG emissions were not compared to a numerical threshold.

Table D-18 CARB Vehicle Emissions Adjustment Factors to Account for the SAFE Vehicles Rule

Year[(1)]	*NO_x*	*TOG Evaporative[(2)]*	*TOG Exhaust[(2)]*	*PM Exhaust[(3)]*	*CO*	*CO_2[(4)]*

2049	1.0209	1.0400	1.0221	1.0510	1.0470	1.1666
2050	1.0210	1.0406	1.0224	1.0512	1.0472	1.1670

Legend: NO_x = nitrogen oxides; TOG = total organic gases; PM = particulate matter; CO = carbon monoxide.

Notes: (1) The adjustment factors apply to the light-duty auto, light-duty truck-1 (LDT1), light-duty truck-2 (LDT2) and medium-duty vehicle categories in CalEEMod.

(2) The TOG adjustment factors were applied to the ROG emission factors in CalEEMod. This study assumed ROG was equivalent to VOC.

(3) The PM adjustment factors were applied to the PM_{10} and $PM_{2.5}$ emission factors in CalEEMod.

(4) The CO_2 adjustment factors were not applied in this analysis because they were published after the quantitative analysis was complete. The factors for all other pollutants in the table were applied.

Source: CARB, 2019a; CARB, 2020c.

On January 20, 2021, President Biden issued EO 13990, which ordered the USEPA and NHTSA to consider, by July 2021, publishing for notice and comment a proposed rule suspending, revising, or rescinding the SAFE Vehicles Rule. Should this rule be rescinded, the emissions of VOC, NO_x, carbon monoxide (CO), PM_{10}, and $PM_{2.5}$ from passenger vehicle trips reported in this analysis would be slightly overstated and therefore conservative.

2.1.11 Hazardous Air Pollutant Speciation of Construction Emissions

The NEPA analysis estimated HAP emissions from proposed construction activities using chemical speciation profiles obtained from the USEPA Speciate 5.1 model and CARB (USEPA, 2020b; CARB, 2020d). The analysis factored emissions of VOCs and PM estimated for each construction source with speciation profiles for total organic gases (TOGs) and PM to derive individual HAP emissions for each source. The NEPA analysis used the amounts of HAP emissions emitted from proposed construction activities as indicators of potential public health impacts.

The analysis chose the following profiles to estimate HAP emissions from proposed construction sources:

- Diesel-powered off-road equipment - Speciate model TOG profile ID 95333 - Diesel Off-road Engines and average of CARB PM profile IDs 6139, 6149, 6159, 6169, and 6179 - Off-road Diesel Vehicle Exhaust.
- Architectural Coatings - Speciate model TOG profile ID 4661 - Industrial surface coating operations - water based.
- Fugitive Dust - Speciate model PM profile ID 4158 - Construction dust.
- Asphalt Paving - Speciate model TOG profile ID 0026 - Asphaltic Concrete - In Place Road Asphalt.
- Delivery and Haul Trucks - Speciate model TOG profile ID 103VBS - Heavy-Duty Diesel with DPF and average of Speciate model PM profile IDs 4945, 4951, 4957, 4961, 4966, and 4969 - Diesel Exhaust – Heavy Heavy-Duty Truck.
- Worker Commuter Vehicles - Speciate model TOG profile ID 8905 - Gasoline Exhaust - E10 gasoline, summer grade, LA92 cycle composite and Speciate model PM profile ID 5566 - Light-Duty Vehicle Exhaust - Gasoline.

2.1.12 Quantified Construction Management Practices and Mitigation Measures

The action alternatives would incorporate several management practices to minimize construction emissions and their associated air quality impacts and human health risks. All management practices are identified and described in Draft EIS Section 3.1.5.9. As discussed in this appendix, the analysis quantified the following management practices for unmitigated construction emissions:

> AQ MGMT-1 (partial). *Fugitive Dust Control Plan.* Watering: Use water spray/mists to minimize dust emissions generated from earthmoving, grading, bulk material handling, and demolition activities and from the movement of vehicles on unpaved roads. Apply water at the end of the work day to areas of soils disturbed during the day.
>
> AQ MGMT-3. *Tier 4 Construction Equipment.* All off-road diesel-powered construction equipment greater than 50 horsepower would meet USEPA Nonroad Final Tier 4 emission standards.

The analysis also quantified the following CEQA mitigation measure to reduce significant levels of daily VOC emissions from construction of Alternatives 4 and 5:

> MM AQ-2. The contractor shall limit the quantity of architectural coatings applied during construction so that VOCs would not exceed 119 pounds per day in the applied coatings.
>
> At the current SDAPCD VOC limit of 50 grams per liter for general flat coatings (SDAPCD Rule 67.0.1 [Architectural Coatings] [SDAPCD, 2021]), this measure equates to a daily limit of 285 gallons of

coatings per day. The daily limit for other coatings would be determined using the following formula: quantity of coating (gallons per day) = 285 x 50/(VOC content of other coatings in grams per liter).

Because the NEPA analysis did not need this measure as mitigation to reduce a significant impact, the NEPA analysis included it as a project element (Management Practice AQ MGMT-5).

All other construction management practices and mitigation measures described in Draft EIS Section 3.1 and Appendix A were not quantified due to model limitations and uncertainty in the degree of implementation.

2.1.13 Estimated Construction Emissions

The tables in Attachment 1.1 of this appendix present the estimated annual construction emissions for Alternatives 1 through 5 that were used in the NEPA analysis (Section 3.1). The tables include criteria pollutant, HAP, and GHG emissions by source and construction year. The tables for Alternatives 4 and 5 were also used in the CEQA analysis (Appendix A).

By convention, total construction GHG emissions were amortized over 30 years before adding them to the operational emissions for comparison to significance thresholds. The amortization approach for construction GHG emissions was based on the South Coast Air Quality Management District's GHG Threshold Working Group Meeting #13 Minutes (SCAQMD, 2009). The resulting annual amortized emissions even out the year-to-year uncertainty and variability in annual emissions and shift the emphasis toward the accumulated total GHG emissions.

The tables in Attachment 1.3 present the estimated maximum daily construction emissions for Alternatives 4 and 5 that were used in the CEQA analysis. The tables include criteria pollutant emissions by source and construction year.

As a default assumption, CalEEMod modeled the construction phases in series, except for foundation drilling, which was added manually and overlapped with the grading and building construction phases. However, given that construction activities for the action alternatives would occur simultaneously on both OTC Site 1 and OTC Site 2 and in multiple areas within each site, construction phases would overlap at various times. Therefore, to estimate a reasonable but conservative maximum daily emissions scenario for Alternatives 4 and 5, several plausible combinations of overlapping phases were evaluated through post-processing calculations performed outside of CalEEMod using the CalEEMod output. The combination producing the highest daily emissions was selected for the analysis.

The following combinations of overlapping phases were evaluated when determining the maximum daily emissions for Navy Development construction in Alternatives 4 and 5:

- Demolition and site preparation
- Grading and utility installation and foundation drilling
- Foundation drilling and building construction
- Grading and utility installation and building construction
- Building construction and paving
- Building construction and architectural coating

The following combinations of overlapping phases were evaluated when determining the maximum daily emissions for Private Development construction in Alternatives 4 and 5:

- Demolition and site preparation

- Grading and utility installation, foundation drilling, and building construction
- Building construction and paving
- Building construction and architectural coating

The tables in Attachment 3.2 present the estimated annual construction and operational emissions for Alternatives 1 and 4 that were used in the general conformity applicability analysis. The tables include VOC and NOx emissions by source and year for those sources subject to general conformity.

The tables in Attachment 4.1 present the estimated annual construction emissions for Alternatives 4 and 5 that were used for the construction HRA in the CEQA analysis. The tables include on-site DPM emissions by source and construction year. The HRA methodology is described below in Section D4 of this appendix.

2.2 Operations Methodology

CalEEMod calculated direct and indirect operational emissions for the following sources:

- Vehicle trips to and from the site generated by the land uses (engine exhaust, particulates from tire wear, brake wear, and road dust)
- Natural gas usage in buildings (combustion exhaust)
- Electricity usage in buildings and parking lots (indirect power plant emissions; GHGs only)
- Architectural coating activities (evaporative VOC emissions from periodic re-painting of buildings and parking lots)
- Use of consumer products (evaporative VOC emissions from cleaning supplies, kitchen aerosols, cosmetics, toiletries, parking lot degreasers, and fertilizers/pesticides)
- Hearth and woodstove usage (combustion exhaust)
- Landscaping equipment (engine exhaust)
- Water usage (indirect power plant emissions associated with supplying and treating water and wastewater, and indirect wastewater decomposition emissions during treatment; GHGs only)
- Solid waste disposal (indirect waste decomposition emissions; GHGs only)
- Mobile equipment (e.g., forklifts, generator sets, off-highway trucks) used during operation (engine exhaust)
- Stationary equipment (e.g., emergency generators, fire pumps) used during operation (engine exhaust)

For electricity use, water use and treatment, and solid waste disposal, CalEEMod quantified only GHG emissions because those activities would produce only indirect emissions. The GHG emissions would be indirect because they would occur from sources owned or controlled by another organization (e.g., power plants, water and wastewater utilities, landfills). CalEEMod quantified criteria pollutant and GHG emissions for all other sources because those emissions would be direct, meaning they would result from direct on-site activities.

To assess NEPA impacts (see Section 3.1) and CEQA impacts (see Appendix A), the analysis included all operational emissions associated with the sources identified in the preceding bullets. For general conformity, the analysis included only the direct and indirect operational emissions from sources that would be practicably controllable and over which the Navy would have continuing program responsibility. Specifically, the general conformity analysis (see Section 3.1.5.2) included (1) all on-site sources associated with the Navy development except stationary equipment, and (2) all off-site vehicle trips associated with the Navy development. The general conformity analysis excluded stationary equipment because the equipment would be issued air permits by the SDAPCD and therefore would not be subject to general conformity. The general conformity analysis also excluded all sources associated with the private development because they would not be practicably controllable by the Navy.

The following methodology describes the key assumptions used in estimating operational emissions for existing conditions and the project alternatives. Project-specific data were used where available. Where project-specific data were lacking, this analysis used a combination of CalEEMod default data for San Diego County and conservative assumptions. Default data were used for portions of the CalEEMod input not specifically discussed below.

2.2.1 Analysis Years

CalEEMod quantified operational emissions for the years 2026, 2030, 2035, and 2050 for each action alternative. Table D-19 provides the operational assumptions for Alternatives 1 through 5 for each analysis year.

CalEEMod quantified operational emissions associated with the No Action Alternative for the same analysis years as Alternatives 1 through 5. For all analysis years, the No Action Alternative was assumed to have the same land uses and number of vehicle trips as existing conditions. The No Action Alternative served as the baseline against which Alternatives 1 through 5 were evaluated for NEPA air quality impacts in Draft EIS Section 3.1 and Alternatives 1 and 4 were evaluated for general conformity applicability in Draft EIS Sections 3.1.5.4 and 3.1.5.7.

Table D-19 Operational Analysis Years and Occupancy Assumptions for Alternatives 1 through 5

Analysis Year	*Assumptions for Navy Development(1)*	*Assumptions for Private Development(2)*
2026	First year of operation; assume 100 percent occupancy	No operation; 0 percent occupancy (under construction)
2030	Continued operation at 100 percent occupancy	Operation at 25 percent occupancy (continued construction)
2035	Continued operation at 100 percent occupancy	Operation at 45 percent occupancy (continued construction)
2050	Continued operation at 100 percent occupancy	Operation at 100 percent occupancy

Notes: (1) The assumptions for Navy Development apply to Alternatives 1 through 5.
(2) The assumptions for Private Development apply to Alternatives 2 through 5. Alternative 1 would have no Private Development.

To identify the overall maximum year of emissions, the analysis interpolated the milestone year operational emissions for each calendar year from 2026 to 2050. The analysis assumed no net change in operational emissions for any action alternative relative to the No Action Alternative prior to 2026.

CalEEMod quantified operational emissions associated with existing conditions at OTC in the year 2020. Existing conditions served as the baseline against which Alternatives 4 and 5 were evaluated for CEQA air quality impacts in Appendix A.

2.2.2 Land Use Elements

Table D-20 shows the CalEEMod land use categories and sizes at buildout for the project alternatives as well as existing conditions. Table D-21 shows the estimated number of residential units by building size category at buildout. Table D-22 shows the assumed residential population at buildout by building size category. Table D-23 shows the estimated number of parking stalls at buildout by CalEEMod parking category. CalEEMod used these values to estimate the default operational quantities of on-road vehicle trips, energy use, architectural coating use, consumer product use, landscaping equipment use, water use, and solid waste production.

The values in Tables D-20 through D-23 were modeled by CalEEMod to represent conditions at full occupancy. These conditions would first occur for the Navy Development in 2026 and for Private Development in 2050 (Alternatives 2 through 5 only). For the intermediate analysis years of 2030 and 2035, the Private Development would operate at approximately 25 and 45 percent of full buildout, respectively. For those analysis years, this analysis modeled the Private Development at full buildout, but with emission factors, vehicle fleet mix, and vehicle trip lengths set at 2030 and 2035 values. The calculated emissions were then multiplied by 25 and 45 percent to estimate the 2030 and 2035 operational emissions.

The approach for modeling vehicle trips associated with the relocated transit center, which would begin operating by 2035, is discussed in more detail below.

Table D-20 Building Floor Space and Paved Surface Area at Buildout, by CalEEMod Category (square feet)

Development Type/CalEEMod Land Use Category	*Existing Conditions, No Action Alternative*	*Alternative 1(1)*	*Alternative 2*	*Alternative 3*	*Alternative 4*	*Alternative 5*
Navy Development(2)	-	-	-	-	-	-
Government Office Building(3)	475,386	1,045,520	874,482	874,482	874,482	874,482

Unrefrigerated Warehouse	271,476	481,941	24,172	24,172	24,172	24,172
Other Asphalt Surfaces(4)	726,935	915,253	57,495	57,495	57,495	57,495
Parking Lot (Asphalt)	1,000,000	1,430,415	0	0	0	0
Unenclosed Parking Structure with Elevator	0	0	630,000	630,000	630,000	630,000
Private Development(5)	-	-	-	-	-	-
Apartments Mid-Rise	0	0	2,880,000	2,304,000	2,880,000	2,880,000
Apartments High-Rise	0	0	3,456,000	1,920,000	6,720,000	4,800,000
General Office Building	0	0	1,000,000	650,000	1,350,000	850,000
Hotel	0	0	260,000	160,000	290,000	290,000
Retail - Strip Mall	0	0	180,000	130,000	250,000	200,000
Government (Civic Center) (Transit Center)	0	0	0	0	140,000	140,000
Parking Lot (Asphalt) (Transit Center)	0	0	0	0	175,000	175,000
Unenclosed Parking Structure with Elevator	0	0	4,123,700	2,741,900	6,090,000	4,782,750
Other Asphalt Surfaces(4)	0	0	989,455	1,243,071	786,516	950,182

Legend: - = no data in cell.

Notes: (1) The values shown for Alternative 1 include the amounts newly constructed on OTC Site 1 and the amounts retained without modification on OTC Site 2.
(2) Navy Development was assumed to be fully operational by 2026.
(3) Includes conference/auditorium space.
(4) Other Asphalt Surfaces include areas such as streets and open storage.
(5) Private Development was assumed to be fully operational by 2050.

Table D-21 Number of Residential Units at Buildout by CalEEMod Land Use Category

Building Height[(1)]	*Existing Conditions, No Action Alternative*	*Alternative 1*	*Alternative 2*	*Alternative 3*	*Alternative 4*	*Alternative 5*
3-10 Levels (mid-rise)	0	0	3,000	2,400	3,000	3,000
>10 Levels (high-rise)	0	0	3,600	2,000	7,000	5,000
Total	**0**	**0**	**6,600**	**4,400**	**10,000**	**8,000**

Note: (1) CalEEMod defines mid-rise and high-rise buildings differently than Draft EIS Section 2.5. The CalEEMod definitions are shown in this table.

Source: M. Carpenter, KTU+A, personal communication, April 13, 2020.

Table D-22 Residential Population at Buildout by CalEEMod Land Use Category

Building Height	*Existing Conditions, No Action Alternative*	*Alternative 1*	*Alternative 2*	*Alternative 3*	*Alternative 4*	*Alternative 5*
3-10 Levels (mid-rise)(1)	0	0	4,309	3,447	4,309	4,309
>10 Levels (high-rise)(1)	0	0	5,171	2,873	10,055	7,182
Total	**0**	**0**	**9,480**	**6,320**	**14,364**	**11,491**

Note: (1) Populations were apportioned to the mid-rise and high-rise categories in proportion to their number of residential units in Table D-21.

Source: Socioeconomics study (Section 3.5).

Table D-23 Number of Parking Stalls at Buildout by CalEEMod Land Use Category

CalEEMod Land Use Category	*Existing Conditions, No Action Alternative*	*Alternative 1*	*Alternative 2*	*Alternative 3*	*Alternative 4*	*Alternative 5*
Navy Development	-	-	-	-	-	-
Multi-story concrete structure	0	0	2,000	2,000	2,000	2,000
Asphalt Lot	2,500	4,541(1)	0	0	0	0
Private Development	-	-	-	-	-	-
Multi-story concrete structure	0	0	11,782	7,834	17,400	13,665
Asphalt Lot (Transit Center)	0	0	0	0	500	500

Legend: - = no data in cell.

Note: (1) The value for Alternative 1 includes 3,180 new parking spaces constructed on OTC Site 1 and 1,361 existing spaces retained on OTC Site 2.

Source: M. Carpenter, KTU+A, personal communication, April 13, 2020, except values for existing conditions and No Action Alternative were estimated by reviewing aerial photographs.

2.2.3 Operational Vehicle Trips

Table D-24 shows the number of daily weekday vehicle trips the analysis modeled in CalEEMod for operation of the project scenarios at buildout. The trip data were obtained from the Draft EIS traffic study. In developing the data, the traffic study included trip reductions to account for transit, bicycle, and pedestrian modes of travel and a mixed-use benefit.

The trip data were entered into CalEEMod by adjusting the default trip rates to force the total number of weekday trips to equal the displayed values. Weekend trips were scaled from the weekday trips in the same relative proportion as the CalEEMod default values. Trips associated with the relocated transit center under Alternatives 4 and 5 are not shown in the table because they were modeled separately.

Table D-24 Operational Weekday Vehicle Trips at Buildout, by CalEEMod Land Use Category (trips/day)

Development Type/CalEEMod Land Use Category[1]	*Existing Conditions, No Action Alternative*	*Alternative 1*	*Alternative 2*	*Alternative 3*	*Alternative 4*	*Alternative 5*
Navy Development[2]	[3]	-	-	-	-	-
Government Office Building	6,132	7,566	4,301	4,301	4,301	4,301
Research & Development	783	149	96	96	96	96
Unrefrigerated Warehouse	85	85	3	3	3	3
Subtotal	**7,000**	**7,800**	**4,400**	**4,400**	**4,400**	**4,400**
Private Development[4][5]	-	-	-	-	-	-
Apartments Mid-Rise	0	0	19,804	15,236	19,830	19,123
Apartments High-Rise	0	0	15,009	8,019	29,223	20,130
General Office Building	0	0	8,462	6,123	9,874	6,962
Hotel	0	0	3,516	2,202	3,679	3,680
Retail - Strip Mall	0	0	7,754	5,611	10,015	8,014
Subtotal	**0**	**0**	**54,546**	**37,192**	**72,622**	**57,909**
Total	**7,000**	**7,800**	**58,946**	**41,592**	**77,022**	**62,309**

Legend: - = no data in cell.

Notes: [1] Parking lot land uses are not shown because they have no associated trips in the CalEEMod methodology. CalEEMod assigns all trips to the residential and commercial land uses.

[2] The traffic study estimated only total trips for the Navy Development. For the CalEEMod inputs, the trips were apportioned to the Navy land use categories in the same relative proportions as the default CalEEMod trips.

[3] Values represent weekday one-way trips. Saturday and Sunday trips were scaled to the same relative proportions as the default CalEEMod Saturday and Sunday trips.

[4] Trip generation values for Private Development include reductions to account for transit, bicycle, and pedestrian modes of travel and a mixed-use benefit. For transit, bicycle, and pedestrian modes of travel, the credit is -1,126, -755, -6,663, and -5,321 daily trips for Alternatives 2, 3, 4, and 5, respectively. For the mixed-use benefit, the credit is -6,374, -4,274, -9,543, and -7,583 daily trips for Alternatives 2, 3, 4, and 5, respectively.

[5] The Transit Center is not shown because its operational vehicle trips were modeled separately. See Table D-31 for the Transit Center trip assumptions.

Source: Traffic Study (Appendix E).

2.2.4 Operational Trip Lengths

Tables D-25 through D-30 present the average vehicle trip lengths associated with operation of OTC for the existing conditions scenario and project alternatives. The analysis used these trip lengths in lieu of the default trip lengths in CalEEMod. They were derived from site- and community-specific SANDAG data provided by the traffic study (LLG Engineers, K.C. Yellapu, personal communications, May 12, 2020; LLG Engineers, J. Boarman, personal communications, May 6, 2020). These data show a downward trend in average trip length over time due to the availability of closer destinations as the area becomes more densely developed.

In general, the analysis modeled each alternative separately in CalEEMod. However, because the Navy development would be nearly identical for Alternatives 2 through 5, the analysis modeled the Navy development under Alternatives 2 through 5 as a single scenario. Nonresidential trip lengths for Alternative 4 (Table D-29) were selected for the scenario because they would be slightly higher and therefore slightly more conservative than the other alternatives. The resulting CalEEMod output was used for the Navy operational emissions for each of Alternatives 2, 3, 4, and 5.

Table D-25 Average Operational Trip Lengths for Existing Conditions and the No Action Alternative

Year	*Daily VMT per Employee(1)(2)*	*Daily Trips per Employee(1)(3)*	*Average Nonresidential Trip Length (mi/trip)*
2020	21.4	2.8	7.7
2026	19.8	2.8	7.1
2030	18.8	2.8	6.7
2035	17.5	2.8	6.3
2050	13.6	2.8	4.9

Legend: VMT = vehicle miles traveled; mi/trip = miles per trip.

Notes: (1) Data for 2050 are from the traffic study and are based on SANDAG data for the OTC (LLG, John Boarman, personal communications, May 6, 2020).
(2) VMT per employee in years 2020 through 2035 were interpolated from 2012 and 2050 data. Data for 2012 are from the traffic study and are based on SANDAG data representative of the Midway-Pacific Highway Community (LLG, K.C. Yellapu, personal communications, May 12, 2020).
(3) The 2050 daily trips per employee were assumed to be representative of all analysis years.

Table D-26 Average Operational Trip Lengths for Alternative 1

Year	*Daily VMT per Employee(1)(2)(3)*	*Daily Trips per Employee(1)(2)(3)*	*Average Nonresidential Trip Length (mi/trip)*
2020	21.4	2.8	7.7
2026	19.8	2.8	7.1
2030	18.8	2.8	6.7
2035	17.5	2.8	6.3
2050	13.6	2.8	4.9

Legend: VMT = vehicle miles traveled; mi/trip = miles per trip.

Notes: (1) Data for 2020 are from Table D-25 (existing conditions).
(2) Data for 2050 are from the traffic study and are based on SANDAG data for the OTC (LLG, John Boarman, personal communications, May 6, 2020).
(3) Intermediate years were interpolated linearly.

Table D-27 Average Operational Trip Lengths for Alternative 2

Year	Daily VMT per Resident(1)(2)(3)	Daily VMT per Employee(2)(3)(4)	Daily Trips per Resident(2)(5)	Daily Trips per Employee(2)(3)(4)	Average Residential Trip Length (mi/trip)	Average Nonresidential Trip Length (mi/trip)
2020	12.4	21.4	3.6	2.8	3.5	7.7
2026	11.2	19.7	3.6	2.7	3.1	7.2
2030	10.5	18.5	3.6	2.7	2.9	6.9
2035	9.5	17.1	3.6	2.6	2.7	6.5
2050	6.6	12.8	3.6	2.5	1.8	5.1

Legend: VMT = vehicle miles traveled; mi/trip = miles per trip.

Notes: (1) Daily VMT per resident in 2020 is from the traffic study and is conservatively based on 2012 SANDAG data representative of the Midway-Pacific Highway Community (LLG, K.C. Yellapu, personal communications, May 12, 2020).

(2) Data for 2050 are from the traffic study and are based on SANDAG data for the OTC (LLG, John Boarman, personal communications, May 6, 2020).

(3) Intermediate years were interpolated linearly.

(4) Nonresidential data for 2020 are from Table D-25 (existing conditions).

(5) The 2050 daily trips per resident were assumed to be representative of all analysis years.

Table D-28 Average Operational Trip Lengths for Alternative 3

Year	Daily VMT per Resident(1)(2)(3)	Daily VMT per Employee(2)(3)(4)	Daily Trips per Resident(1)(2(3	Daily Trips per Employee(2)(3)(4)	Average Residential Trip Length (mi/trip)	Average Nonresidential Trip Length (mi/trip)
2020	12.4	21.4	3.6	2.8	3.5	7.7
2026	11.5	19.8	3.6	2.8	3.2	7.2
2030	10.9	18.7	3.6	2.7	3.0	6.9
2035	10.2	17.4	3.6	2.7	2.8	6.5
2050	8.0	13.5	3.6	2.6	2.2	5.2

Legend: VMT = vehicle miles traveled; mi/trip = miles per trip.

Notes: (1) Residential data for 2020 are from Table D-27 to ensure that all alternatives interpolate from the same 2020 starting point.

(2) Data for 2050 are from the traffic study and are based on SANDAG data for the OTC (J. Boarman, LLG, personal communication, May 6, 2020).

(3) Intermediate years were interpolated linearly.

(4) Nonresidential data for 2020 are from Table D-25 (existing conditions).

Table D-29 Average Operational Trip Lengths for Alternative 4

Year	*Daily VMT per Resident(1)(2)(3)*	*Daily VMT per Employee(2)(3)(4)*	*Daily Trips per Resident(1)(2)(3*	*Daily Trips per Employee(2)(3)(4)*	*Average Residential Trip Length (mi/trip)*	*Average Nonresidential Trip Length (mi/trip)*
2020	12.4	21.4	3.6	2.8	3.5	7.7
2026	10.8	19.3	3.5	2.7	3.1	7.3

(2) Data for 2050 are from the traffic study and are based on SANDAG data for the OTC (John Boarman, personal communication, May 6, 2020).

(3) Intermediate years were interpolated linearly.

(4) Nonresidential data for 2020 are from Table D-25 (existing conditions).

2.2.5 Transit Center Trips

Table D-31 shows the number of daily weekday vehicle trips modeled in CalEEMod for operation of the relocated transit center under Alternatives 4 and 5. The trip data were obtained from the EIS traffic study. This analysis adjusted the default trip rates in CalEEMod to force the number of trips to equal the traffic study values. The weekday trips were also used for Saturday and Sunday trips.

Table D-31 Operational Daily Vehicle Trips for the Transit Center for Alternatives 4 and 5

Modeling Scenario[(1)]	*Daily Trips, 2035[(2)]*	*Daily Trips, 2050[(2)]*
Absolute Number of Trips (for informational purposes)	3,010	3,220
Increased Number of Trips Relative to 2020 Existing Conditions (for CEQA)	210	420

Notes: (1) The number of trips would be the same for Alternatives 4 and 5. The remaining alternatives would not include a transit center at the OTC.
(2) The daily trips were modeled seven days per week.
Source: Traffic study.

Because the transit center would move from its current location to OTC under Alternatives 4 and 5, the method of analysis required transit center operational vehicle trips to be modeled separately from the rest of Alternatives 4 and 5. All other types of operational emissions associated with the transit center (energy consumption, architectural coating, consumer products, landscaping, water usage, and solid waste disposal) were included in the CalEEMod operational runs for the rest of Alternatives 4 and 5.

Transit center operational vehicle trips were modeled differently under NEPA and CEQA because of the different baselines. The NEPA baseline is the No Action Alternative, evaluated in the same future analysis year as the action alternatives. Therefore, the proposed relocation of the transit center would result in essentially no change in emissions relative to the NEPA baseline because the vehicle trips would merely shift from one location to another. (Section 3.1 addresses the potential effects on local carbon monoxide ambient concentrations resulting from the Proposed Action and alternatives, including the Transit Center.) As a result, it was unnecessary for the NEPA analysis to model transit center trips in CalEEMod because there would be no emissions impact from the shift in location. However, for informational purposes only, total transit center trips were modeled in CalEEMod to show the magnitude of emissions associated with the transit center.

The CEQA baseline is 2020 existing conditions. Therefore, for CEQA, the predicted increases in transit center vehicle trips in the future analysis years, relative to 2020 conditions, were modeled in CalEEMod. The CEQA analysis conservatively attributed the resulting emissions increases to Alternatives 4 and 5 even though the predicted trip increases would occur regardless of whether the transit center shifts locations.

SANDAG provided an estimated vehicle trip length of 6.52 miles per trip for the transit center (Kirsten Uchitel, personal communication, April 29, 2020). The default trip lengths in CalEEMod were replaced with this modified trip length.

2.2.6 Vehicle Emission Factors

This analysis used EMFAC2014 emission factors, adjusted per the SAFE Vehicles Rule, in CalEEMod to calculate the emissions from operational vehicle trips. Section D3.1.10, above, describes the rationale for the selection of CalEEMod 2016.3.2 with built-in EMFAC2014 emission factors as well as the methodology for applying the adjustment factors. No SAFE Vehicles Rule adjustments were necessary for 2020 existing conditions because the effects of the rule started in 2021.

2.2.7 Energy Use

CalEEMod estimated direct criteria pollutant and GHG emissions from the combustion of natural gas for space and water heating in buildings. CalEEMod also estimated indirect GHG emissions from electricity use by the residential and nonresidential land uses. At the time of this analysis, the estimates for natural gas and electricity use associated with the project alternatives in the infrastructure study (Draft EIS Section 3.11) were not final. Therefore, for the new land uses associated with the action alternatives, this analysis used CalEEMod default energy consumption rates that assume compliance with the California Energy Code (Title 24, Part 6 of the CCR). For existing conditions, the No Action Alternative, and the unmodified land uses in Alternative 1 (on OTC Site 2), this analysis used CalEEMod default energy consumption rates that are based on default historical data. A comparison of Tables D-2 and D-20 shows that approximately 30 percent of the warehouse and parking lot space under Alternative 1 at buildout would be unmodified and therefore represented by historical data rather than Title 24.

CalEEMod used default San Diego Gas and Electric (SDG&E) energy intensity factors (i.e., the amount of CO_2, methane (CH_4), and nitrous oxide (N_2O) per megawatt-hour) to quantify indirect GHG emissions associated with electricity use. The current state mandate for renewable energy (Renewables Portfolio Standard) is 50 percent by 2026 and 60 percent by 2030. However, CalEEMod's default energy intensity factors assume only a 10.2 percent procurement of renewable energy for all analysis years (SDG&E, 2011). Sempra Energy's corporate sustainability report for 2018 (Sempra Energy, 2019) indicates that SDG&E had already achieved 45 percent renewable energy by 2018. Therefore, this analysis modified the SDG&E energy intensity factors in CalEEMod to reflect 45 percent renewables in 2020 (assuming 2020 is similar to 2018), 50 percent in 2026, and 60 percent in 2030, 2035, and 2050. Table D-32 presents the modified SDG&E energy intensity factors that the analysis used in CalEEMod.

Table D-32 San Diego Gas & Electric Intensity Factors

Year	*Percent of Total Energy from Renewables[1]*	*CO_2 (lb./MWh)*	*CH_4 (lb/MWh)[2]*	*N_2O (lb/MWh)[2]*
2009[3]	*10.2%*	720.49	0.029	0.006
2018 to 2020[4]	*45%*	480	0.019	0.004
2026[5]	*50%*	436	0.018	0.0036
2030 to 2050[6]	*60%*	349	0.014	0.0029

Legend: CO_2 = carbon dioxide; CH_4 = methane; N_2O = nitrous oxide; lb/MWh = pounds per megawatt-hour.

Notes: (1) The percent renewables for 2009 and 2018 are actual values. The percent renewables for 2026 and 2030-2050 are per the California Renewables Portfolio Standard, which mandates 50 percent renewables by 2026 and 60 percent renewables by 2030.

(2) CH_4 and N_2O factors for 2018 and later are scaled from the CO_2 factor in proportion to the 2009 factors.

(3) The 2009 intensity factors are the CalEEMod default factors for SDG&E.

(4) The 2018 CO_2 factor is the most recent available factor for SDG&E, from Page 62 of Sempra Energy's *2018 Corporate Sustainability Report* (Sempra Energy, 2019). Assume the 2018 factors are representative of 2020 factors.

(5) The 2026 CO_2 factor is scaled from the 2018 factor by the following formula: $[480/(1-0.45)]\times(1-0.5)$.

(6) The 2030 to 2050 CO_2 factor is scaled from the 2018 factor by the following formula: $[480/(1-0.45)]\times(1-0.60)$.

2.2.8 Consumer Products

The CalEEMod default emission factor for consumer products usage is based on a statewide inventory of VOC emissions and statewide building area (CAPCOA, 2017). This analysis adjusted the default emission factor to a San Diego County-specific value. Appendix H of the PEIR for the Midway-Pacific Highway Community Plan Update shows the derivation of the adjusted value (City of San Diego, 2018b). The San Diego County-specific consumer product emission factor of ROG was estimated to be 0.0000165 pound/square-foot/day, based on San Diego County daily emissions of consumer products and county-wide building square footage data. This analysis assumed that ROG is equivalent to VOC.

2.2.9 Architectural Coating

CalEEMod estimated the interior and exterior building surface areas and asphalt surface area to be re-painted annually during operation, based on the land use sizes shown in Table D-20. CalEEMod assumed a default 10 percent annual reapplication rate for operations. The analysis used an architectural coating VOC limit of 50 grams per liter for interior (flat) coatings and 100 grams per liter for exterior (non-flat) and pavement coatings to reflect the requirements of SDAPCD Rule 67.0.1.

2.2.10 Hearths and Woodstoves

In accordance with Management Practice AQ MGMT-18, the residential uses of the Proposed Action and alternatives would have no hearths or fireplaces. Therefore, the analysis set the CalEEMod hearth and woodstove usages to zero.

2.2.11 Landscaping Equipment

The analysis quantified operational landscaping emissions outside of CalEEMod using emission factors developed in Appendices H and I of the PEIR for the Midway-Pacific Highway Community Plan Update (City of San Diego, 2018b). Table D-33 presents the landscaping emission factors. The emission factors are based on CARB daily emission estimates for lawn and garden equipment for San Diego County and San Diego regional nonresidential and residential development acreages. Because they are on a per-acre basis, the off-model emission factors are more representative of urban and higher-density land uses than the CalEEMod default emission factors. The CalEEMod default emission factors are on a per-dwelling unit or per building space basis and therefore tend to overestimate landscaping emissions for high-rise developments with a lot of units or building space.

This analysis applied the County-specific landscaping emission factors to all constructed acreages shown in Table D-33. Maximum daily emissions included an additional factor of 7, which assumed that all OTC landscaping emissions would occur on one day per week (i.e., seven days-worth of average daily emissions would occur on one day each week). Landscaping emissions were assumed to be negligible for existing conditions, the No Action Alternative, and OTC Site 2 under Alternative 1 because the existing OTC has relatively few landscaped areas that would require the regular use of landscaping combustion equipment.

Table D-33 Landscaping Emission Factors for the San Diego Region

Land Use Category	*VOC (lb/day per acre)*	*NO_x (lb/day per acre)*	*CO (lb/day per acre)*	*SO_x (lb/day per acre)*	*PM_{10} (lb/day per acre)*	*$PM_{2.5}$ (lb/day per acre)*	*CO_2e (MT/yr per acre)*
Residential	0.02059	0.00098	0.09875	0	0.00022	0.00016	0.04227
Commercial	0.00444	0.00055	0.04285	0	0.0001	0.00008	0.04227

Legend: VOC = volatile organic compounds; NO_x = nitrogen oxides; CO = carbon monoxide; SO_x = sulfur oxides; PM_{10} = particulate matter less than 10 microns in diameter; $PM_{2.5}$ = particulate matter less than 2.5 microns in diameter; CO_2e = carbon dioxide equivalent; lb/day = pounds per day; MT/yr = metric tons per year.

Source: Appendices H and I of the PEIR for the Midway-Pacific Highway Community Plan Update (City of San Diego, 2018b).

2.2.12 Water and Wastewater

The amount of water used and wastewater generated by a land use has indirect GHG emissions associated with it. These emissions are a result of the energy used to supply, distribute, and treat water and wastewater. CalEEMod used the SDG&E electricity intensity factors in Table D-32 to quantify the GHG emissions associated with the energy used to transport the water. In addition to the indirect GHG emissions associated with energy use, CalEEMod also quantified indirect CH_4 and N_2O emissions produced from the wastewater treatment process using default assumptions.

At the time of this analysis, the estimates for water demand and wastewater generation associated with the Proposed Action and alternatives in the infrastructure study (Draft EIS Section 3.11) were not final. Therefore, this analysis used the CalEEMod default assumptions with the following adjustment. To incorporate the CalGreen standards, this analysis applied a 20 percent reduction to the default indoor water use for the new land uses associated with Alternatives 1 through 5. No reduction was applied to existing conditions, the No Action Alternative, and the unmodified land uses in Alternative 1 (on OTC Site 2).

Additionally, in accordance with Management Practice AQ MGMT-11, Alternatives 1 through 5 would use water-efficient landscape irrigation systems. Therefore, CalEEMod assumed a default 6.1 percent reduction in outdoor water use per this measure. Although CalEEMod classified this measure as mitigation, this analysis treated it as a project element.

2.2.13 Solid Waste

The disposal of solid waste produces indirect GHG emissions from anaerobic decomposition in landfills, incineration, and transportation of waste. At the time of this analysis, the estimates for annual solid waste generation during operation of the project alternatives in the hazardous materials study (Draft EIS Section 3.7) were not final. Therefore, this analysis used CalEEMod default assumptions, which are based on annual waste disposal rates from the California Department of Resources Recycling and Recovery (CalRecycle). CalEEMod assumed a default 50 percent diversion of solid waste from landfills through reduction, recycling, and compost programs. This assumption is conservative because AB 341 mandated that 75 percent of the solid waste generated be reduced, recycled, or composted by 2020. To be consistent with the hazardous materials study, this analysis did not assume a 75 percent diversion rate.

2.2.14 Operational Equipment

The Navy currently operates, and plans to operate, mobile and stationary equipment at OTC. Table D-34 lists the anticipated operational equipment by alternative. Alternatives 2 through 5 would have smaller warehouse and laydown areas and therefore less mobile equipment than the existing conditions scenario, No Action Alternative, and Alternative 1. In accordance with Management Practice AQ MGMT-9, all operational diesel equipment greater than 50 horsepower (i.e., the diesel forklift, generator set, and emergency standby generators) used for Alternatives 1 through 5 would meet Tier 4 nonroad emission standards.

The initial CalEEMod runs for Alternatives 1 through 5 assumed default, non-Tier 4 emission factors for all operational equipment. For the mobile Tier 4 equipment, the analysis performed subsequent CalEEMod runs, included in this appendix, to determine the emission reductions. For the stationary Tier 4 equipment, scaling factors were applied to the CalEEMod outputs to determine the emission reductions. Tables D-A1.2-18 through D-A1.2-20 in Attachment 1.2 show the derivation of the emission reductions associated with the Tier 4 operational equipment. The pre-mitigation emissions tables presented for Alternatives 1 through 5 in Section 3.1 and Appendix A include these emission reductions.

Table D-34 Operational Equipment Activity Data for Navy Development

Equipment Type	*Fuel*	*Equip. Count, Existing and No Action Alternative*	*Equip. Count, Alternative 1*	*Equip. Count, Alternatives2-5*	*Daily Usage Hours per Day*	*Annual Usage Days per Year*	*Horsepower Rating*	*Engine Load Factor (unitless)*
Mobile Equipment[1]	-	-	-	-	-	-	-	-
Forklift	Propane[2]	6	6	2	8	260	89	0.2
Forklift	Diesel	4	4	1	8	260	89	0.2
Generator Set	Diesel	1	1	0	2	260	84	0.74
Off-Highway Truck	Diesel	2	2	0	8	260	50[3]	0.38
Stationary Equipment[4]	-	-	-	-	-	-	-	-
Emergency Standby Generator	Diesel	1	1	1	5	20	165	0.73
Emergency Standby Generator	Diesel	1	1	1	5	20	187	0.73

Legend: - = no data in cell; Alt. = Alternative; hr./day = hours per day; days/year = days per year; hp = horsepower.

Notes: [1]Operating days per year, rated horsepower, and load factors for mobile equipment are CalEEMod defaults unless otherwise noted. All other values are site-specific.

[2] Compressed natural gas was selected as the most similar available option in CalEEMod.

[3] Horsepower rating was modified to a value typical of a John Deere Gator utility vehicle.

[4] Load factors for the stationary equipment are CalEEMod defaults. All other values for stationary equipment are site-specific. The SDAPCD maintains operating permits for the existing stationary equipment.

Sources: For mobile equipment: Navy (R. Desmarais, NAVWAR, personal communications, April 21, 2020) and Navy (K. Ketron, Naval Information Warfare Center Pacific, personal communications, April 23, 2020). For stationary equipment: Navy (R. Chichester, Naval Base Point Loma, personal communications, April 14, 2020).

2.2.15 Land Use Change and Carbon Sequestration

This analysis assumed no GHG impacts related to land use changes or carbon sequestration.

2.2.16 Hazardous Air Pollutant Speciation of Operational Emissions

The NEPA analysis estimated HAP emissions from proposed operations activities using chemical speciation profiles obtained from the USEPA Speciate 5.1 model and CARB. The analysis factored emissions of VOCs and PM estimated for each operations source with speciation profiles for TOGs and PM to derive individual HAP emissions for each source. The NEPA analysis used the amounts of HAP emissions emitted from proposed operations activities as indicators of potential public health impacts.

The analysis chose the following profiles to estimate HAP emissions from proposed operations sources:

- Commuter Vehicles - Speciate model TOG profile ID 8905 - Gasoline Exhaust - E10 gasoline, summer grade, LA92 cycle composite and Speciate model PM profile ID 5566 - Light-Duty Vehicle Exhaust - Gasoline.
- Consumer products - Speciate model TOG profile ID 3040 - Consumer Products: Multipurpose Solvents.
- Architectural Coatings - Speciate model TOG profile ID 4661 - Industrial surface coating operations - water based.
- Landscaping Equipment - Speciate model TOG profile ID 95506 - 4-Stroke Small Off-road Engine Exhaust - MTBE Gasoline.
- Natural Gas Use - Speciate model TOG profile ID 0003 - External Combustion Boiler - Natural Gas and Speciate model PM profile 91156 - Residential Natural Gas Combustion - Composite.

2.2.17 Quantified Operational Management Practices

The action alternatives would incorporate several sustainability-oriented management practices that are consistent with the City of San Diego CAP and its implementing CAP Consistency Checklist (City of San Diego, 2016a; City of San Diego, 2017), as well as the City's Midway-Pacific Highway Community Plan (City of San Diego, 2018a). All design features are identified and described in Draft EIS Section 3.1.5.9. As discussed in this appendix, the analysis quantified the following design features for unmitigated operational emissions:

AQ MGMT-9. *Tier 4 Operational Equipment.* All off-road diesel-powered equipment greater than 50 horsepower used for operations would meet USEPA Nonroad Final Tier 4 emission standards.

AQ MGMT-11. *Sustainable Landscape Design.* The project would incorporate sustainable landscape design where feasible, including:

- Plant trees to provide shade and CO_2 absorption
- Use drought-tolerant native vegetation
- Reduce use of lawn types that require high levels of irrigation
- Use high-efficiency irrigation technology or recycled site water
- Design buildings to capture and store rainwater for landscape irrigation

No other operational management practice described in EIS Section 3.1.5.9 was quantified due to model limitations and uncertainties in the degree of implementation. However, the operational vehicle trip rates developed by the EIS traffic study and used in the air quality analysis (see Section D3.2.3) took into consideration some of the vehicle trip reduction techniques proposed in management practices AQ MGMT-23 through AQ MGMT-30 (such as transit, bicycle, and pedestrian measures).

2.2.18 Estimated Operational Emissions

The tables in Attachment 1.2 of this appendix present the estimated annual operational emissions for the existing conditions scenario, the No Action Alternative, and Alternatives 1 through 5 that were used in the NEPA analysis (Section 3.1). The tables include criteria pollutant, HAP, and GHG emissions by source and operational analysis year. The tables for existing conditions and Alternatives 4 and 5 were also used in the CEQA analysis (Appendix A).

The tables in Attachment 1.4 present the estimated maximum daily operational emissions for existing conditions and Alternatives 4 and 5 that were used in the CEQA analysis. The tables include criteria pollutant emissions by source and operational analysis year.

The tables in Attachment 3.2 present the estimated annual construction and operational emissions for Alternatives 1 and 4 that were used in the general conformity applicability analysis. The tables include VOC and NOx emissions by source and year for those sources subject to general conformity.

3 Construction HRA for the CEQA Analysis

This appendix describes the methods and results of a HRA of TAC emissions associated with construction of OTC project Alternatives 4 and 5. The HRA is a Tier 1 risk assessment for the CEQA analysis in accordance with the California Office of Environmental Health Hazard Assessment's (OEHHA's) Guidance Manual for Preparation of Health Risk Assessments (OEHHA, 2015). The HRA also followed supplemental guidance issued by SDAPCD (SDAPCD, 2019). The HRA calculated cancer and non-cancer risks to the community surrounding OTC associated with TAC emissions from construction-related equipment and trucks operating on-site during construction of the project.

TACs are compounds that are known or suspected to cause adverse health effects from human exposure. In this HRA, the TAC of potential concern was DPM. Under OEHHA risk assessment guidance, DPM is used as a surrogate for the complex mixture of chemicals that make up whole diesel exhaust. DPM is the main driver of cancer risk from construction equipment.

The HRA used a five-step process to estimate incremental health impact results: (1) quantify construction-related DPM emissions; (2) identify ground-level receptor locations that may be affected by emissions, including a regular receptor grid as well as specific sensitive receptor locations nearby such as schools, hospitals, and child care centers; (3) perform dispersion modeling analyses to estimate ambient DPM concentrations at each receptor location; and (4) quantify the potential health risks at each receptor location and compare to significance criteria. The following sections provide additional details on the HRA methodology.

3.1 Significance Criteria

The City of San Diego does not specify health risk thresholds for TAC exposure in its CEQA guidelines (City of San Diego, 2016b). SDAPCD Rule 1210 (SDAPCD, 2013) provides the following health risk public notification thresholds for permitted stationary sources, which are based on the OEHHA guidance:

- Maximum incremental cancer risk equal to or greater than 10 chances in one million. Incremental cancer risk is the increased chance that a person would develop cancer from exposure to project-generated TAC emissions over a period of 30 years for a resident or 25 years for a worker.
- Cancer burden equal to or greater than 1.0. Cancer burden is the estimated additional number of persons within the project's zone of impact that would contract cancer over a 70-year lifetime because of exposure to project-generated TAC emissions.
- Total chronic non-cancer health hazard index equal to or greater than 1.0. The chronic non-cancer health hazard index is a ratio of the project's long-term (i.e., 1-year or longer) average ambient TAC concentrations relative to the reference concentrations below which adverse health effects would not be expected to occur.

This HRA evaluated health risks relative to these thresholds.

3.2 Quantification of Emissions

This HRA quantified on-site construction-related DPM emissions using the methodology described above (see Appendix D3). The HRA used the PM_{10} diesel engine exhaust emissions estimated by CalEEMod as equivalent to DPM emissions. The HRA assumed all construction equipment, haul trucks, and vendor vehicles would be diesel-powered.

The analysis assumed all construction equipment emissions would occur on-site. To estimate the on-site emissions from haul trucks and vendor vehicles, the analysis scaled the total trip emissions by multiplying by the ratio of on-site driving distance to total driving distance. As specified in Management Practice AQ MGMT-3, the quantification of DPM emissions assumed all off-road diesel-powered construction equipment greater than 50 horsepower would meet USEPA Nonroad Final Tier 4 emission standards. Tables D-35 and D-36 present the annual on-site DPM emissions associated with construction of Alternatives 4 and 5, respectively. Attachment 4.1 of this appendix shows the scaling methodology for on-site haul truck and vendor trip emissions.

Table D-35 Annual On-Site Construction DPM Emissions, Alternative 4

Year	*Off-Road Equipment (lbs.)*	*Haul Trucks (lbs.)(1)*	*Vendor Trips (lbs.)(1)*
2021	100.9	0.02	0.02
2022	105.8	0.00	0.02
2023	96.8	0.00	0.01
2024	89.4	0.00	0.01

Note: [1] On-site emissions from haul trucks and vendor trips were scaled from the total trip emissions by multiplying by the ratio of on-site to total driving distance.

3.3 Air Dispersion Modeling Methodology

The HRA performed air dispersion modeling to calculate the concentrations of DPM at receptors in the OTC vicinity during construction. The following sections describe the methodology used for modeling, including model selection, source characterization, meteorological data, and receptor placement.

3.3.1 Model Selection

The HRA performed air dispersion modeling using the USEPA AERMOD dispersion model, version 19191 (USEPA, 2019), based on the *Guideline on Air Quality Models* (USEPA, 2017). AERMOD predicts ambient pollutant concentrations at user-specified receptor locations based on user-supplied inputs for emission sources, terrain, and meteorological conditions. AERMOD has been approved for use in various regulatory applications by USEPA, CARB, and SDAPCD. The AERMOD input and output files are included in Attachment 4.2.

The HRA selected the regulatory default option and period averaging in AERMOD, based OEHHA and SDAPCD guidance (OEHHA, 2015; SDAPCD, 2019). Modeling was conducted with urban dispersion coefficients based on the existing land use surrounding the project area. In accordance with SDAPCD guidance, a population of 62,382, which is the population within 3 kilometers of the OTC site, was input for the urban option (SDAPCD, 2019).

3.3.2 Source Characterization

Construction DPM emissions were modeled in AERMOD as AreaPoly sources, which are irregularly shaped polygons. The following three AreaPoly sources were modeled:

- OTC1 represents the construction DPM emissions that would occur on OTC Site 1 for the private development under Alternatives 4 and 5.
- OTC2PRIV represents the construction DPM emissions that would occur on the private development portion of OTC Site 2 under Alternatives 4 and 5.
- OTC2NAVY represents the construction DPM emissions that would occur on the Navy development portion of OTC Site 2 under Alternatives 4 and 5.

The AERMOD sources are depicted in Figure D-1. The sources were modeled with a plume centerline height of 5 meters above ground and an initial vertical dimension of 1.4 meters, which are consistent with a construction modeling study conducted by the South Coast Air Quality Management District to establish its localized significance thresholds (SCAQMD, 2008). Source ground elevations were determined using the USEPA AERMAP model (USEPA, 2018a) and 1-arc-second national elevation dataset elevation data obtained from the United States Geological Survey (2020).

AERMOD modeled construction emissions as occurring from 7:00 a.m. to 7:00 p.m. to align with the City of San Diego noise ordinance. For compatibility with the risk assessment model, Hot Spots Analysis & Reporting Program (HARP), each emission source in AERMOD was modeled with a 1 gram per second “unit” emission rate. The estimated DPM emission rates for each source were input directly in HARP. The DPM emission rates were apportioned to each modeled AERMOD source in proportion to the source’s surface area. Attachment 4.1 of this appendix shows the derivation of DPM emissions by AERMOD source for Alternatives 4 and 5.

3.3.3 Meteorology

The SDAPCD provided an AERMOD-ready meteorological data set for use in the HRA (SDAPCD, personal communication with Cynthia Gould, August 21, 2020). The SDAPCD selected a meteorological station at the San Diego International Airport, approximately 1.0 mile southeast of OTC, as the most representative of conditions near OTC. The data set includes hourly readings of wind speed, wind direction, temperature, and atmospheric stability parameters over a three-year period from January 1, 2010 to December 31, 2012. Figure D-2 shows a wind rose of the meteorological data set. Each “petal” indicates the frequency at which the wind blows from a particular direction, and the colors indicate the range of observed wind speeds. The wind rose shows that the predominant wind direction in the project area is from the north-northwest (i.e., toward the east-southeast). AERMOD calculated average unit DPM concentrations over the entire meteorological data period, which were used for all health risk calculations in HARP.

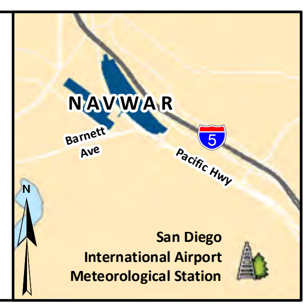
Sources: Esri, 2018; Navy, 2019; SANDAG, 2020



3.3.4 Receptors

AERMOD predicted ambient DPM concentrations on a 4-kilometer by 4-kilometer grid of 4,141 modeled receptor points centered on OTC. To capture maximum concentrations with adequate resolution, receptor grid points within 300 meters of OTC were spaced every 25 meters. To determine the geographical extent of impacts, receptor grid points farther than 300 meters from OTC were spaced every 100 meters. Receptor points were also placed along the OTC site boundaries at 25-meter intervals.

Additional receptor points were positioned directly on sensitive nonresidential locations within 0.5 mile (0.8 kilometer) of OTC. These represent locations where persons especially susceptible to adverse health effects from TACs (i.e., children, the elderly, and the ill) would be expected to congregate. In accordance with SDAPCD HRA guidance, sensitive receptors include known locations of schools (grades Kindergarten through 12), day care centers, nursing homes, retirement homes, health clinics, and hospitals. The locations of sensitive receptors were determined with mapping programs and the review of data from applicable organizations, such as the San Diego Unified School District. The sensitive receptors identified for inclusion in this HRA are described in Attachment 4.4.

To apply the appropriate TAC exposure assumptions, the HRA classified each modeled receptor as either residential, worker, or sensitive based on existing land use. Modeled receptors inside OTC boundaries or in unoccupied locations such as roads and parking lots were not included in the determination of maximum health risk impacts. Figure D-3 shows the modeled receptor locations and classifications. For visual clarity, unoccupied modeled receptors (i.e., receptors not classified as residential, worker, or sensitive) are shown as blank areas in the figure.

3.4 Quantification of Health Risks

The HRA performed the health risk calculations using the HARP Air Dispersion Modeling and Risk Tool, version 19121 (CARB, 2019b). The HARP input and output files are provided in Attachment 4.3. HARP quantified the following types of health effects at each modeled receptor:

- Individual cancer risk, which is the additional chance for a person to contract cancer after long-term (multiple year) exposure to project TAC emissions. For this project, HARP estimated the inhalation dose of DPM at each modeled receptor using the AERMOD output. HARP multiplied the DPM dose by the DPM inhalation cancer potency factor to estimate the individual cancer risk at each receptor. The DPM inhalation cancer potency factor is shown in Table D-37.
- Population cancer burden, which is the expected number of additional cancer cases within the project's zone of impact. The zone of impact is defined as the geographical area where the project's 70-year individual lifetime cancer risk is equal to or greater than one chance in a million. For this project, AERMOD and HARP estimated the individual lifetime cancer risk (determined as described in the first bullet) at the centroids of all census blocks in the zone of impact. Cancer burden was determined by multiplying the cancer risk by the census block population for each census block and summing the results for all census blocks in the zone of impact. The population data are from the 2010 U.S. census and are built into HARP. Figure D-4 shows the zone of impact and location of the census block centroids modeled for the cancer burden calculation. The zone of impact corresponds to Alternative 4 because Alternative 4 would produce a larger impact area than Alternative 5. To be conservative, the analysis modeled census block centroids within and slightly beyond the zone of impact boundary.

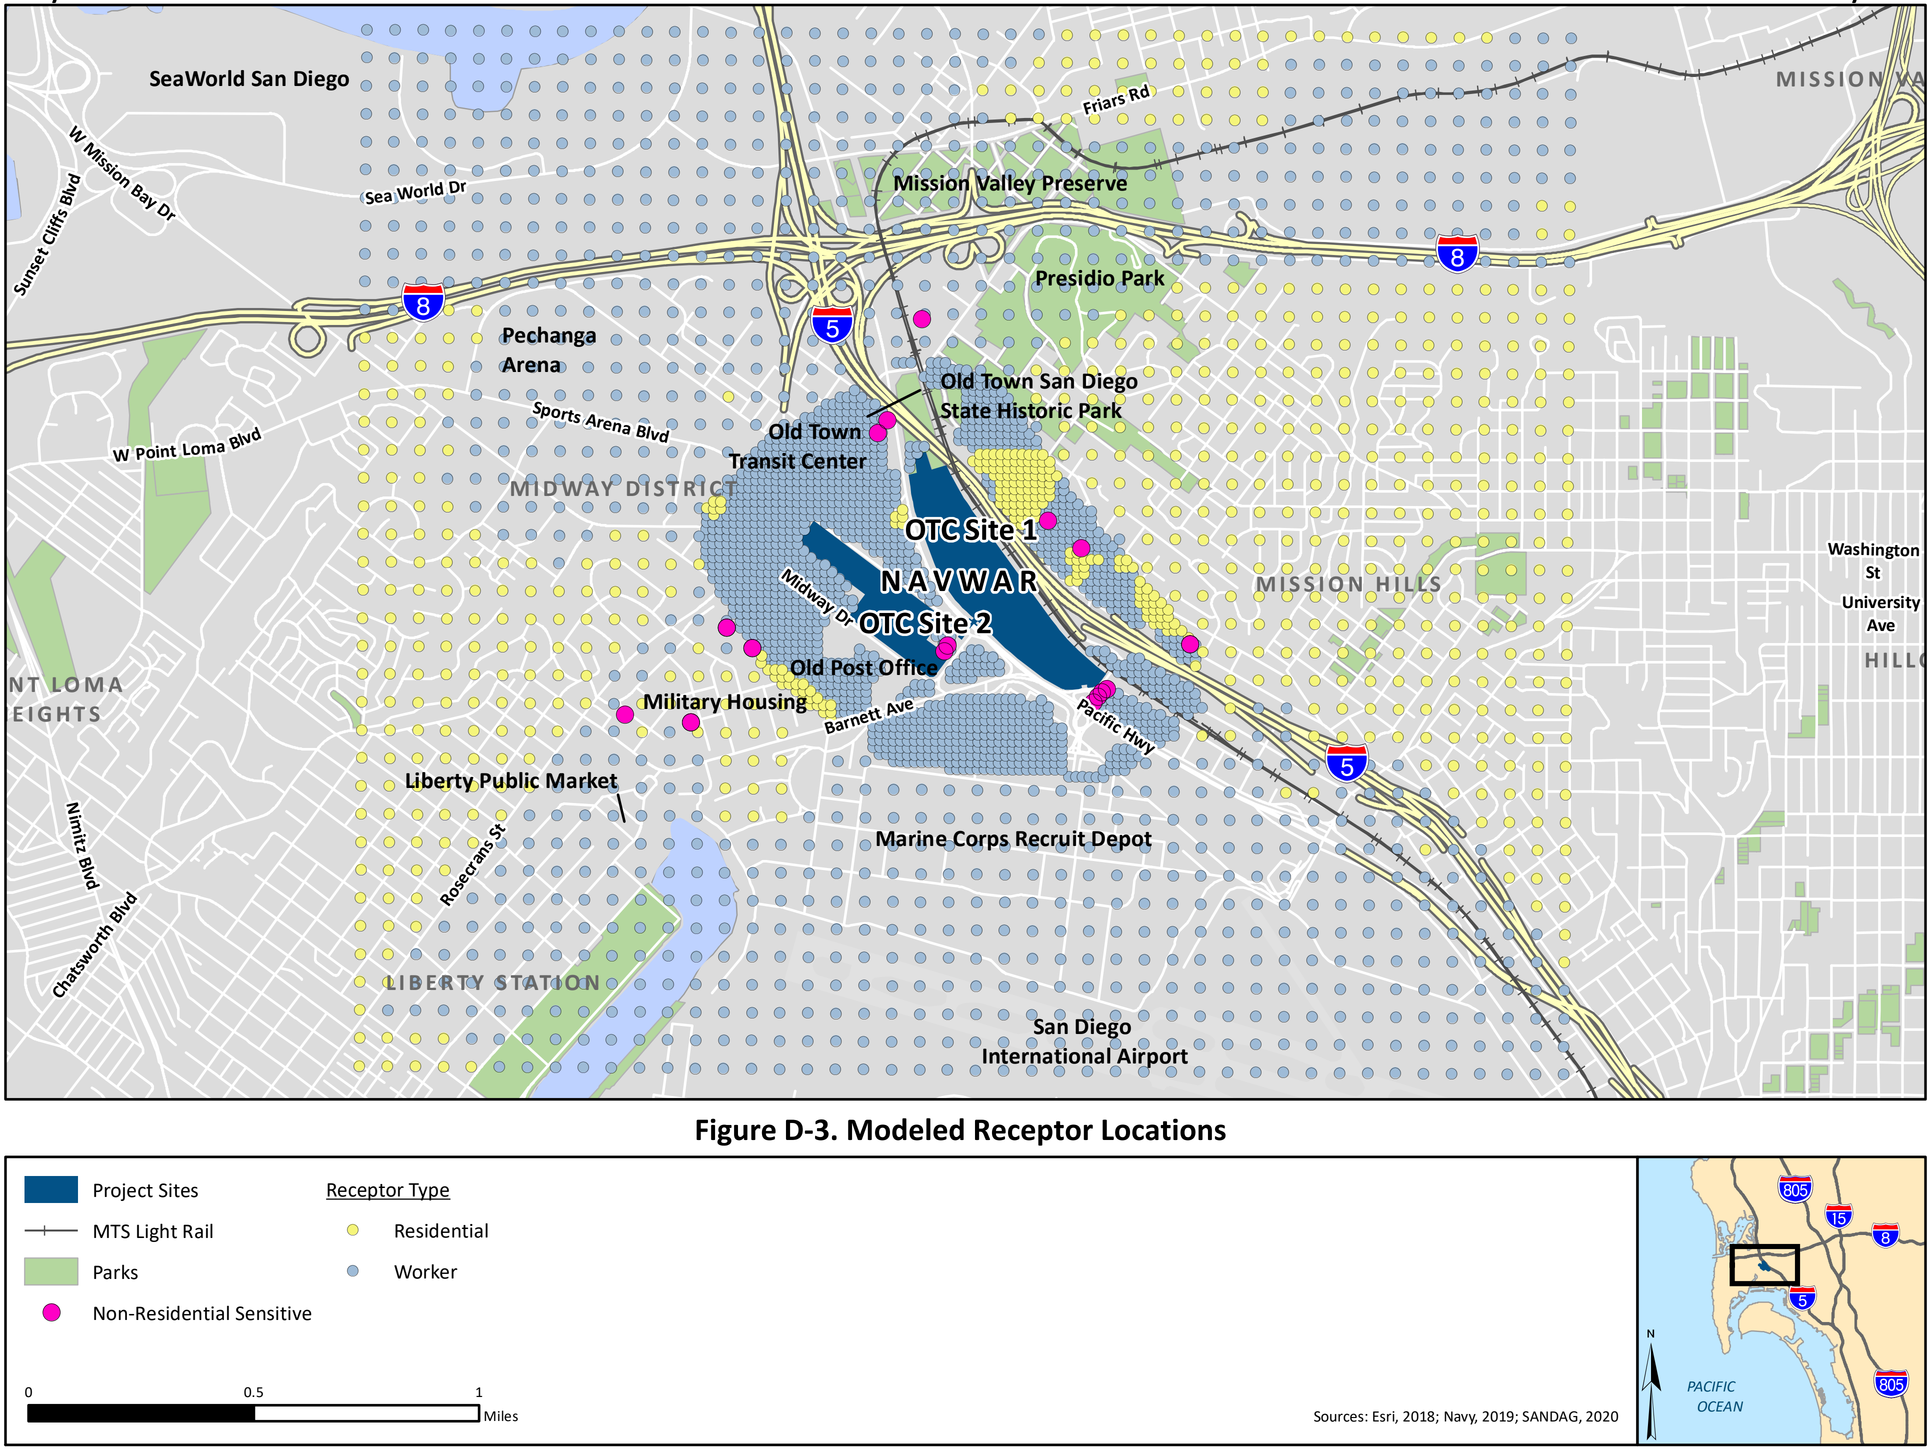


Figure D-3. Modeled Receptor Locations

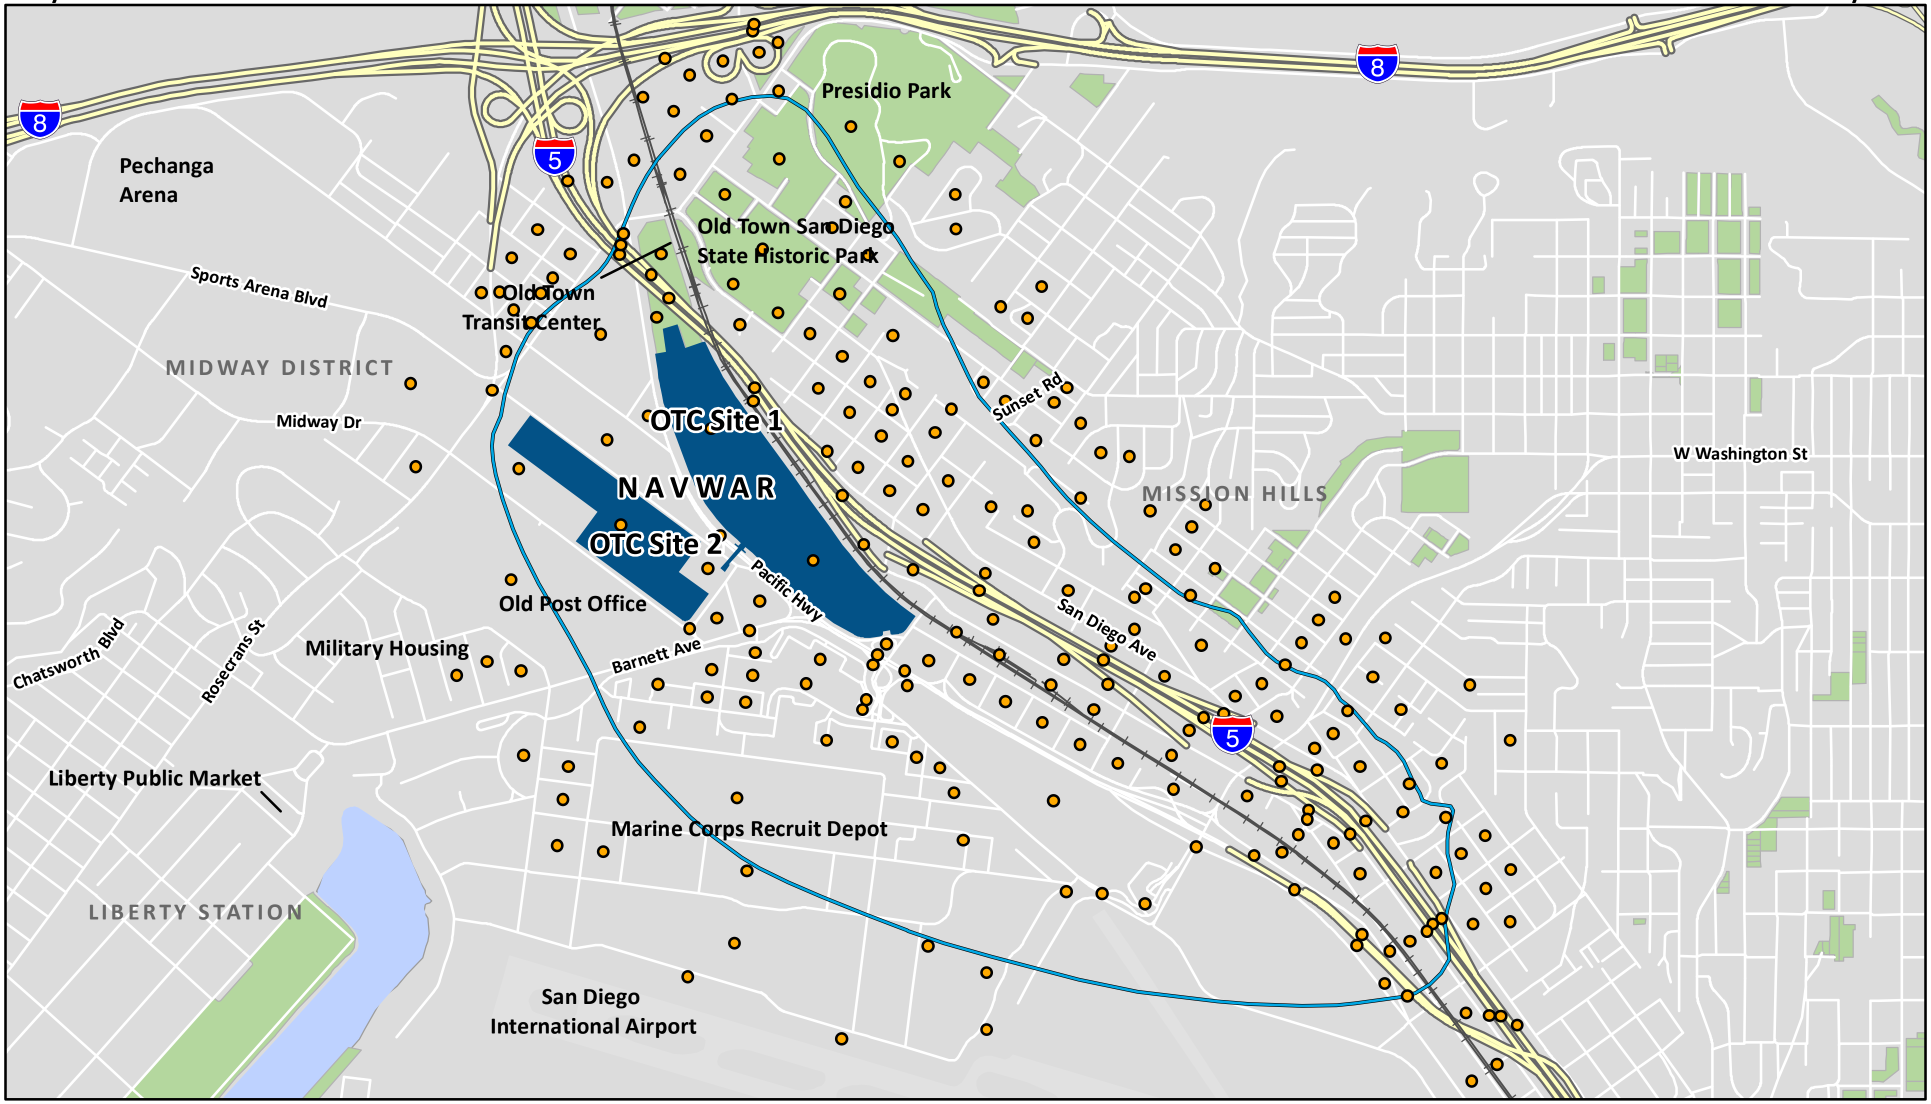

Figure D-4. Modeled Census Block Centroids

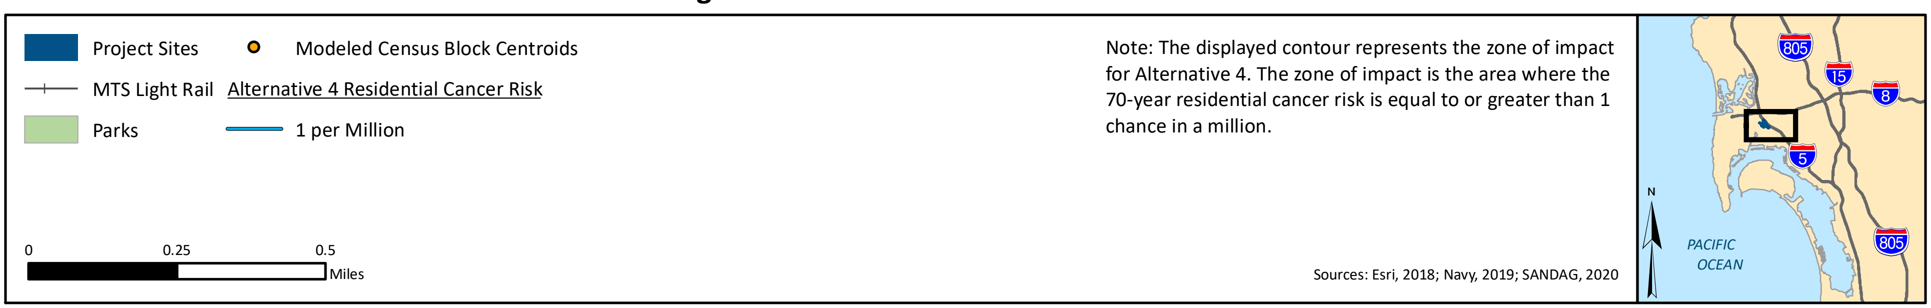

- The chronic hazard index, which is a ratio of long-term TAC exposures to TAC reference exposure levels (RELs). A chronic hazard index below 1.0 indicates that adverse non-cancer health effects on a particular human organ system (target organ) from long-term exposure are not expected. For this project, HARP estimated the ambient DPM concentration at each modeled receptor using the AERMOD output. HARP divided the DPM concentration by the DPM inhalation REL to estimate the chronic hazard index at each receptor. The DPM inhalation chronic REL is shown in Table D-37. The respiratory system is the target organ for chronic non-cancer DPM exposure.

Table D-37 DPM Toxicity Factors Used In the HRA

Toxic Air Contaminant	*Inhalation Cancer Potency Factor $(mg/kg\text{-}d)^{-1}$*	*Inhalation Chronic Non-cancer REL $(\mu g/m^3)^{(1)}$*
Diesel Particulate Matter (DPM)	1.1	5

Legend: mg/kg-d = milligrams of dose per kilogram body weight per day; REL = reference exposure level; $\mu g/m^3$ = micrograms per cubic meter.

Note: (1) The respiratory system is the target organ corresponding to the DPM inhalation chronic non-cancer REL.

Source: CARB, 2020e.

CARB and OEHHA have not established 1-hour (acute) or 8-hour non-cancer RELs for DPM; therefore, the HRA did not quantify non-cancer health risks associated with short-term DPM exposures (CARB, 2020e).

3.4.1 Exposure Assumptions

The DPM exposure pathways evaluated in this HRA were selected in accordance with OEHHA guidance. The inhalation pathway must be evaluated for all TACs. OEHHA guidance also requires the evaluation of non-inhalation exposure pathways for specific TACs. However, the DPM exposure pathway is limited to inhalation (CARB, 2020e).

Table D-38 summarizes the primary exposure assumptions used in this HRA to calculate individual cancer risks. The exposure assumptions for residential and occupational receptors were obtained from OEHHA and SDAPCD risk assessment guidance (OEHHA, 2015; SDAPCD, 2019). Consistent with OEHHA guidance, this study assumed exposure periods of 30 years for a residence and 25 years for an off-site worker.

Table D-38 Cancer Risk Exposure Assumptions

Receptor Exposure Type	*Receptor Age*	*Receptor Exposure Duration (years)*	*Project Construction Years(1)*	*Daily Breathing Rate (L/kg-day)*	*Age Sensitivity Factor(2)*	*Fraction of Time at Home(2)*
Residential(3)	3TM < 2 years	2.25	1-2(4)	1,090(5)	10	1
Residential	2 < 16 years	14	3-16	572(6)	3	1
Residential	16 < 30 years	14	17-30	261(6)	1	0.73
Worker	≥ 16 years	25	1-25	230(7)	1	see note(8)

Legend: L/kg-day = liters of air per kilogram body weight per day; 3TM < 2 years = third trimester (before birth) to less than age 2; 2 < 16 years = age 2 to less than age 16; 16 < 30 years = age 16 to less than age 30; ≥ 16 years = age 16 and older.

Notes: (1) The average annual DPM emissions over the specified construction years were modeled in HARP.
(2) Exposure parameters are consistent with OEHHA guidance (OEHHA, 2015).
(3) The 30-year cancer risk equals the sum of the risks associated with the three displayed residential sub-periods.
(4) The average annual DPM emissions from the first two years of project construction were used for the third trimester before birth and the first two years after birth.
(5) Breathing rate is 95th percentile, per SDAPCD guidance (SDAPCD, 2019). The breathing rate during the third trimester was assumed to be 361 L/kg-day (95th percentile).
(6) Breathing rate is 80th percentile, per SDAPCD guidance (SDAPCD, 2019). The corresponding HARP option is “RMP Using the Derived Method”.
(7) Breathing rate is 95th percentile, per OEHHA guidance (OEHHA, 2015).
(8) This HRA conservatively assumed the off-site worker's schedule would coincide with the project's construction schedule, and therefore the worker would be potentially exposed to all of the project's construction DPM emissions. The corresponding HARP setting is a worker adjustment factor of 4.2.

Because the residential exposure assumptions vary by the exposed individual’s age, and because the project construction DPM emissions would vary by year, it was necessary to subdivide the 30-year residential exposure period into the three sub-periods shown in Table D-38. For each sub-period, HARP modeled the annual average DPM emissions corresponding to that sub-period. The HRA then manually summed the cancer risks estimated by HARP for each sub-period to obtain the 30-year residential cancer risk.

The residential exposure assumptions for cancer risk are conservative because they assumed that the exposure of an individual would begin in the third trimester before birth and would continue until age 30 (or, in this case, until project construction ends). This assumption maximized use of the higher breathing rates, age sensitivity factors, and fraction of time at home associated with infants and children (see Table D-38). Because the 30-year residential cancer risk is the most sensitive to TAC exposures in the early years of an individual’s life, this HRA evaluated three possible scenarios for when the individual would enter the third trimester before birth and therefore begin to be exposed to construction DPM emissions. This approach ensured identification of the highest possible cancer risks given the year-to-year variation in construction DPM emissions. The maximum risk from the three scenarios was then selected at each modeled receptor. The three scenarios are:

- **Scenario A: Exposure starts when Navy development construction starts (year 2021).** This scenario captures all 29 years of construction emissions (see Tables D-35 and D-36).
- **Scenario B: Exposure starts when private development construction starts (year 2026).** This scenario captures the final 24 years of construction emissions. Although it excludes Navy development construction (2021-2025), this scenario may produce higher risks at some

locations because it would align the first two years of private development construction emissions with the most sensitive two years (i.e., first two years) of the individual's life.

- **Scenario C: Exposure starts when the second year of private development construction starts (year 2027).** This scenario captures the final 23 years of project construction emissions. Although it excludes Navy development construction and the first year of private development construction, this scenario may produce higher risks at some locations because it would pair the maximum two years of private development construction emissions with the most sensitive two years of the individual's life.

For cancer burden, the HRA used the 30-year residential exposure assumptions shown in Table D-38 as the 70-year exposure assumptions because all project construction emissions would occur within a 30-year period. Therefore, the 30-year and 70-year residential cancer risks associated with project construction would be the same.

The off-site worker exposure assumptions for cancer risk assumed 25 years of exposure to an individual aged 16 and older. This HRA conservatively assumed the off-site worker's daily and weekly schedule would coincide with the project's construction schedule, and therefore the worker would be potentially exposed to all project construction DPM emissions during the first 25 years of construction.

For cancer risk to sensitive receptors, this study used conservative exposure assumptions based on the receptor type. Veterans Village of San Diego, located at 4141 Pacific Highway, has transitional housing with residence durations up to 2 years (Cause IQ, 2020). Therefore, the HRA assumed the individual would begin exposure in the third trimester before birth and continue until age 2 (i.e., 2¼ years of exposure during the most sensitive age range). The Best Start Birth Center, at 3630 Enterprise Street, would expose pregnant mothers and mothers with infants intermittently for relatively brief periods on the order of a year or less. The accumulated exposure duration would be relatively short; therefore, the HRA reported 25-year worker risks for this sensitive receptor because the worker risks would be higher than the risks to the mothers and infants. All other sensitive receptors were modeled with conservative default 30-year residential exposure assumptions.

For the chronic non-cancer hazard index, HARP conservatively modeled the maximum year of construction DPM emissions to estimate maximum long-term DPM concentrations at each modeled receptor. HARP then divided the DPM concentrations by the inhalation chronic REL to produce the hazard index at each receptor.

3.4.2 Health Risk Results

3.4.2.1 Alternative 4

Table D-39 presents the maximum predicted health impacts from construction of Alternative 4. The table includes estimates of individual cancer risk and chronic non-cancer hazard index at the maximally exposed off-site residential, worker, and sensitive receptors. Figure D-5 shows the receptor locations that correspond to the maximum cancer risk results from Alternative 4 construction. Attachment 4.4 lists the estimated health impacts at every modeled sensitive receptor (including residential receptors).

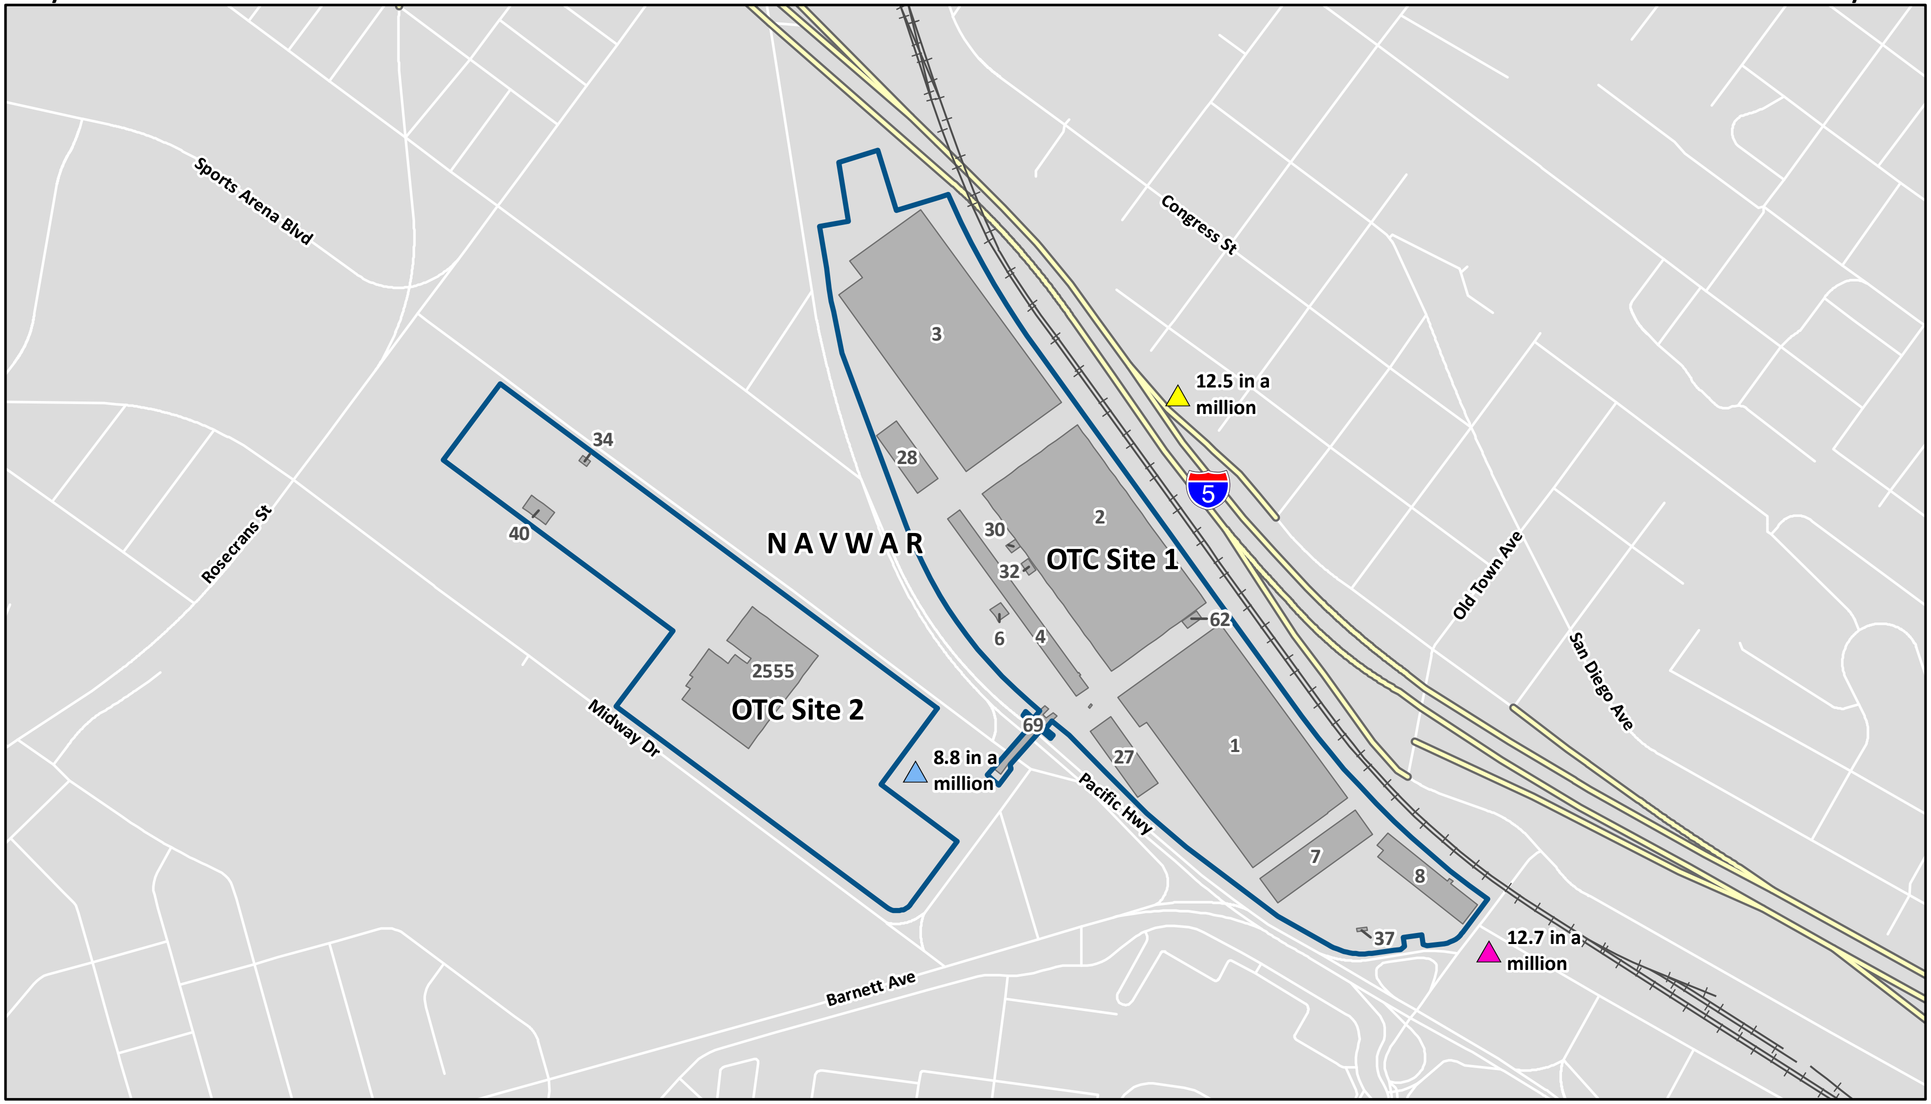

Figure D-5. Location of Maximum Cancer Risk Impacts from Construction Emissions Alternative 4

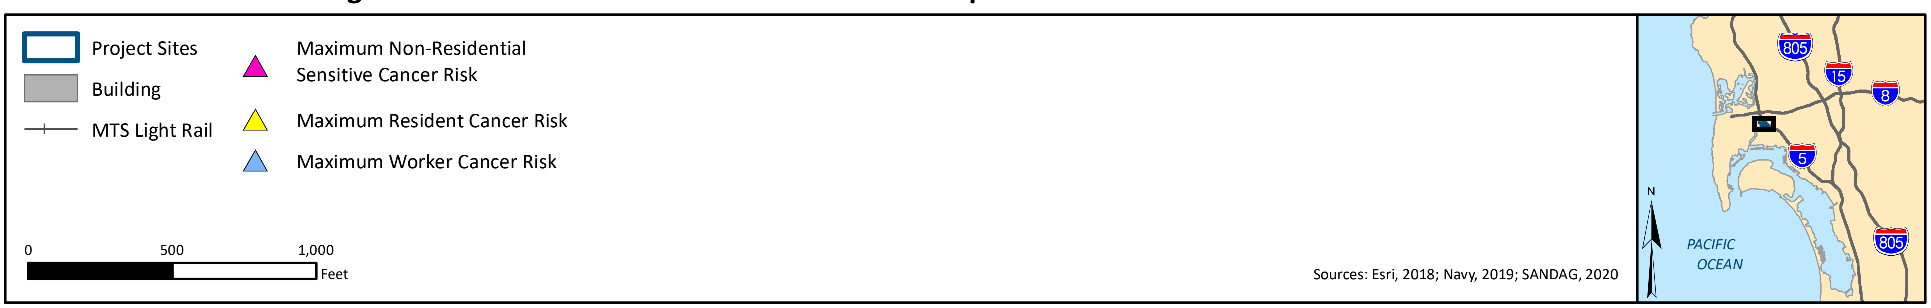

Table D-39 Summary of Health Risk Impacts from Construction of Alternative 4

Receptor Type	*Maximum Cancer Risk (chances in a million)*	*Maximum Chronic Non-cancer Hazard Index*
Residential	12.5	0.004
Worker	8.8	0.03
Sensitive	12.7	0.03
Significance Threshold	**10**	**1.0**
Exceeds Threshold?	**Yes**	**No**

The maximum cancer risk to a residential receptor from Alternative 4 construction would be 12.5 chances in a million. This value would exceed the significance threshold of 10 chances in a million. The maximum residential receptor location is north of Conde Street and just east of I-5. The estimated cancer risk at that location conservatively assumed a 30-year residential exposure starting in the third trimester before birth and continuing to age 30. Figure D-6 shows a plot of 30-year residential risk contours associated with Alternative 4 construction over a project area map.

The maximum cancer risk to an off-site worker from Alternative 4 construction would be 8.8 chances in a million. This value would be less than the significance threshold of 10 chances in a million. The maximum worker receptor location is near the intersection of Pacific Highway and Enterprise Street. The estimated cancer risk at that location conservatively assumed the worker's schedule would match the OTC construction schedule over a 25-year period.

The maximum cancer risk to a sensitive receptor from Alternative 4 construction would be 12.7 chances in a million. This value would exceed the significance threshold of 10 chances in a million. The maximum sensitive receptor location is at the Veteran's Village of San Diego, located at 4141 Pacific Highway. The estimated cancer risk at that location conservatively assumed a 2¼-year residential exposure starting in the third trimester before birth and continuing to age 2. The modeled receptor was conservatively positioned near the edge of the Veteran's Village property closest to OTC.

The maximum chronic non-cancer hazard indices from Alternative 4 construction would be 0.004, 0.03, and 0.03 at a residential, worker, and sensitive receptor, respectively. These hazard indices would be well below the significance threshold of 1.0. Therefore, this HRA predicted that no adverse non-cancer health effects associated with long-term exposure to Alternative 4 construction emissions would occur.

Table D-40 presents the population cancer burden associated with Alternative 4 construction. The estimated cancer burden of 0.013 additional cancer cases within the zone of impact would be well below the significance threshold of 1.0. Attachment 4.5 includes the cancer burden calculations.

Table D-40 Population Cancer Burden from Construction of Alternative 4

Cancer Burden (additional cancer cases)	*Significance Threshold*	*Exceeds Threshold?*
0.013	1.0	No

3.4.2.2 Alternative 5

Table D-41 presents the maximum predicted health impacts from construction of Alternative 5. The table includes estimates of individual cancer risk and chronic non-cancer hazard index at the maximally exposed off-site residential, worker, and sensitive receptors. Figure D-7 shows the receptor locations that correspond to the maximum cancer risk results from Alternative 5 construction. Attachment 4.4 lists the estimated health impacts at every modeled sensitive receptor (including residential receptors).

Table D-41 Summary of Health Risk Impacts from Construction of Alternative 5

Receptor Type	*Maximum Cancer Risk (chances in a million)*	*Maximum Chronic Non-cancer Hazard Index*
Residential	9.7	0.003
Worker	8.2	0.03
Sensitive	9.9	0.03
Significance Threshold	**10**	**1.0**
Exceeds Threshold?	**No**	**No**

The maximum cancer risk to a residential receptor from Alternative 5 construction would be 9.7 chances in a million. This value would be less than the significance threshold of 10 chances in a million. The maximum residential receptor location is north of Conde Street and just east of I-5. The estimated cancer risk at that location conservatively assumed a 30-year residential exposure starting in the third trimester before birth and continuing to age 30. Figure D-8 shows a plot of 30-year residential risk contours associated with Alternative 5 construction over a project area map.

The maximum cancer risk to an off-site worker from Alternative 5 construction would be 8.2 chances in a million. This value would be less than the significance threshold of 10 chances in a million. The maximum worker receptor location is near the intersection of Pacific Highway and Enterprise Street. The estimated cancer risk at that location conservatively assumed the worker's schedule would match the OTC construction schedule over a 25-year period.

The maximum cancer risk to a sensitive receptor from Alternative 5 construction would be 9.9 chances in a million. This value would be less than the significance threshold of 10 chances in a million. The maximum sensitive receptor location is at the Veteran's Village of San Diego, located at 4141 Pacific Highway. The estimated cancer risk at that location conservatively assumed a 2¼-year residential exposure starting in the third trimester before birth and continuing to age 2. The modeled receptor was conservatively positioned near the edge of the Veteran's Village property closest to OTC.

The maximum chronic non-cancer hazard indices from Alternative 5 construction would be 0.003, 0.03, and 0.03 at a residential, worker, and sensitive receptor, respectively. These hazard indices would be well below the significance threshold of 1.0. Therefore, this HRA predicted that no adverse non-cancer health effects associated with long-term exposure to Alternative 5 construction emissions would occur.

Table D-42 presents the population cancer burden associated with Alternative 5 construction. The estimated cancer burden of 0.011 additional cancer cases within the zone of impact would be well below the significance threshold of 1.0. Attachment 4.5 includes the cancer burden calculations.

Cancer Burden (additional cancer cases)	*Significance Threshold*	*Exceeds Threshold?*
0.011	1.0	No

3.4.2.3 Risks Impacts Associated with Planned Regional Land Use

This HRA evaluated health risks to the existing land uses in the neighborhoods surrounding OTC. EIS Section 3.4 presented a planned regional land use map (See Figure 3.4-5 in Draft EIS Section 3.4, *Land Use*) that shows several areas near OTC that are currently nonresidential but planned for future mixed use. This HRA did not quantify health risks for the planned mixed-use areas because it was unknown at the time of analysis when (if ever) these areas would convert to mixed use during the OTC construction period. In lieu of specific cancer risk estimates for these areas, Figure D-9 shows a plot of the 30-year residential cancer risk from Alternative 4 construction superimposed over the planned regional land use map. The figure shows that the potential future establishment of new residences near OTC during project construction could expose new residents to cancer risks higher than those reported in this HRA for the existing land uses. However, the magnitude of risk would depend on the location of the new residences and how early during OTC project construction they would become occupied.

3.4.3 Uncertainties

This risk analysis included the use of conservative exposure assumptions that likely overestimated actual exposure and risk. For cancer risks, the analysis assumed that residents below the age of 16 years would be exposed for 24 hours per day, 365 days per year at the modeled location. However, young residents usually leave their houses for school, shopping, vacation, etc. Further, it assumed that residents would live in the modeled location for the entire 30-year exposure period, whereas in reality, people move periodically instead of living 30 years at the same location. As a result, reported risks are upper-bound calculations, and actual risks would likely be lower than reported.

Health risk assessments such as the one presented in this appendix are not intended to provide estimates of the absolute health risk or expected incidence of disease in a population, but instead are conducted to allow comparisons of the potential health impacts of different alternatives to each other and to significance criteria. Consistent with agency guidelines and standard approaches to regulatory risk assessment, this risk assessment used health protective (conservative) assumptions to provide a margin of safety with respect to human health. OEHHA has provided a discussion of risk uncertainty, which is reiterated here (OEHHA, 2015):

OEHHA has striven to use the best science available in developing these risk assessment guidelines. However, there is a great deal of uncertainty associated with the process of risk assessment. The uncertainty arises from lack of data in many areas necessitating the use of assumptions. The assumptions used in these guidelines are designed to err on the side of health protection in order to avoid underestimation of risk to the public.

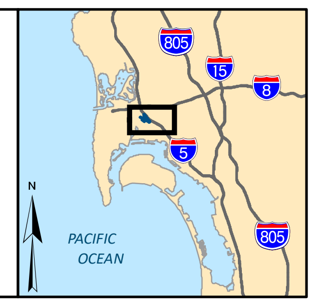
Sources: Esri, 2018; Navy, 2019; SANDAG, 2020



Sources of uncertainty, which may overestimate or underestimate risk, include: 1) extrapolation of toxicity data in animals to humans, 2) uncertainty in the estimation of emissions, 3) uncertainty in the air dispersion models, and 4) uncertainty in the exposure estimates. In addition to uncertainty, there is a natural range or variability in measured parameters defining the exposure scenario. Scientific studies with representative sampling and large enough sample sizes can characterize this variability. In the specific context of a Hot Spots risk assessment, the source of variability with the greatest quantitative impact is variation among the human population in such properties as height, weight, food consumption, breathing rates, and susceptibility to chemical toxicants. OEHHA captures at least some of the variability in exposure by developing data driven distributions of intake rates, where feasible, in the Technical Support Document for Exposure Assessment.

Interactive effects of exposure to more than one carcinogen or toxicant are addressed in the risk assessment with default assumptions of additivity. Cancer risks from all carcinogens addressed in the HRA are added. Similarly, non-cancer hazard quotients for substances impacting the same target organ/system are added to determine the hazard index. Although such effects of multiple chemicals are assumed to be additive by default, several examples of synergism (interactive effects greater than additive) are known. For substances that act synergistically, the HRA could underestimate the risks. Some substances may have antagonistic effects (lessen the toxic effects produced by another substance). For substances that act antagonistically, the HRA could overestimate the risks.

Other sources of uncertainty, which may underestimate or overestimate risk, can be found in exposure estimates where little or no data are available (e.g., soil half-life and dermal penetration of some substances from a soil matrix).

The differences among species and within human populations usually cannot be easily quantified and incorporated into risk assessments. Factors including metabolism, target site sensitivity, diet, immunological responses, and genetics may influence the response to toxicants. The human population is much more diverse both genetically and culturally (e.g., lifestyle, diet) than inbred experimental animals. The intraspecies variability among humans is expected to be much greater than in laboratory animals. In most cases, cancer potency values have been estimated only for the single most affected tumor site. This represents a source of uncertainty in the cancer risk assessment. Adjustment for tumors at multiple sites induced by some carcinogens may result in a higher potency. Some recent assessments of carcinogens include such adjustments. Other uncertainties arise (1) in the assumptions underlying the dose-response model used, and (2) in extrapolating from large experimental doses, where other toxic effects may compromise the assessment of carcinogenic potential, to usually much smaller environmental doses.

When occupational epidemiological data are used to generate a carcinogenic potency or a health protective level for a non-carcinogen, less uncertainty is involved in the extrapolation from workplace exposures to environmental exposures. When using human data, no interspecies extrapolation is necessary, eliminating a significant source of uncertainty. However, children are a subpopulation whose hematological, nervous, endocrine, and immune systems are still developing and who may be more sensitive to the effects of toxicants on their developing systems. The worker population and risk estimates based on occupational epidemiological data are more uncertain for children than adults. Current risk assessment guidelines include procedures designed to address the possibly greater sensitivity of infants and children, but there are only a few compounds for which these effects have actually been measured experimentally. In most cases, the adjustment relies on default assumptions which may either underestimate or overestimate the true risks faced by infants and children exposed to toxic substances or carcinogens.

Risk estimates generated by an HRA should not be interpreted as the expected rates of disease in the exposed population but rather as estimates of potential for disease, based on current knowledge and a number of assumptions.

In the Hot Spots program, cancer risk is often expressed as the maximum number of new cases of cancer projected to occur in a population of one million people due to exposure to the cancer-causing substance over a 30-year residential period. However, there is uncertainty associated with the cancer risk estimate. An individual's risk of contracting cancer from exposure to facility emissions may be less or more than the risk calculated in the risk assessment. An individual's risk not only depends on the individual's exposure to a specific chemical but also on his or her genetic background, health, diet, lifestyle choices and other environmental and workplace exposures. OEHHA uses health protective exposure assumptions to avoid underestimating risk. For example, the risk estimate for airborne exposure to chemical emissions uses the health protective assumption that the individual has a high breathing rate and exposure began early in life when cancer risk is highest.

An REL is the concentration level at or below which no adverse non-cancer health effects are anticipated for the specified exposure duration. RELs are based on the most sensitive, relevant, adverse health effect reported in the medical and toxicological literature. RELs are designed to protect the most sensitive individuals in the population by the inclusion of factors that account for uncertainties as well as individual differences in human susceptibility to chemical exposures. The factors used in the calculation of RELs are meant to err on the side of public health protection in order to avoid underestimation of non-cancer hazards. Exceeding the REL does not automatically indicate an adverse health impact. However, increasing concentrations above the REL value increases the likelihood that the health effect will occur.

Risk assessments under the Hot Spots program are often used to compare one source with another and to prioritize concerns. Consistent approaches to risk assessment are necessary to fulfill this function.

4 Health Effects of Criteria Pollutants for the CEQA Analysis

Criteria air pollutants are defined as pollutants for which the federal and state governments have established ambient air quality standards, or criteria, for outdoor concentrations to protect public health. The federal and state standards have been set, with an adequate margin of safety, at levels above which concentrations could be harmful to human health and welfare. These standards are designed to protect the most sensitive people from illness or discomfort. Pollutants of concern include ozone, nitrogen dioxide (NO_2), CO, sulfur dioxide (SO_2), PM_{10}, $PM_{2.5}$, and lead. In California, sulfates, vinyl chloride, hydrogen sulfide, and visibility-reducing particles are also regulated as criteria air pollutants. These pollutants are discussed in the following paragraphs (USEPA, 2018b; CARB, 2020b; CARB, 2009; San Diego State University, 2020).

Ozone

Ozone is a colorless gas that is not directly emitted into the atmosphere but is formed when VOCs, sometimes referred to as ROG, and NO_x react in the presence of ultraviolet sunlight. The primary sources of VOCs and NO_x, the precursors of ozone, are automobile exhaust and industrial sources. Meteorology and terrain play major roles in ozone formation, and ideal conditions occur during summer and early autumn on days with low wind speeds or stagnant air, warm temperatures, and cloudless skies. Because ozone-forming photochemical reactions are not instantaneous and depend on the meteorological conditions, peak ozone levels can occur miles downwind of the sources of precursor emissions. Short-term exposures (lasting for a few hours) to ozone at levels typically observed in Southern California can result in breathing pattern changes, reduction of breathing capacity, increased susceptibility to infections, inflammation of the lung tissue, and some immunological changes.

Nitrogen Dioxide

Most NO_2, like ozone, is not directly emitted into the atmosphere but is formed by an atmospheric chemical reaction between nitric oxide (NO) and atmospheric oxygen. NO and NO_2 are collectively referred to as NO_x and are major contributors to ozone formation. The primary sources of NO, the precursor to NO_2, include automobile exhaust and industrial sources. High concentrations of NO_2 can cause breathing difficulties and can produce a brownish-red cast to the atmosphere that reduces visibility. There is some indication of a relationship between NO_2 and chronic pulmonary fibrosis, and some increase in bronchitis in children (2 and 3 years old) has also been observed at concentrations below 0.3 ppm by volume.

Carbon Monoxide

CO is a colorless and odorless gas formed by the incomplete combustion of carbonaceous materials, including fossil fuels. CO is emitted almost exclusively from motor vehicles, power plants, refineries, industrial boilers, ships, aircraft, and trains. In urban areas, such as the project location, automobile exhaust accounts for most CO emissions. CO is a non-reactive air pollutant that dissipates relatively quickly; therefore, ambient CO concentrations generally follow the spatial and temporal distributions of vehicular traffic. CO concentrations are influenced by local meteorological conditions, primarily wind speed, topography, and atmospheric stability. CO from motor vehicle exhaust can become locally concentrated when surface-based temperature inversions are combined with calm atmospheric conditions, a typical situation at dusk in urban areas between November and February. In terms of health, CO competes with oxygen, often replacing it in the blood, thus reducing the blood's ability to transport oxygen to vital organs. The results of excess CO exposure can be dizziness, fatigue, and impairment of central nervous system functions.

Sulfur Dioxide

SO_2 is a colorless, pungent gas formed primarily by the combustion of sulfur-containing fossil fuels. The main sources of SO_2 are power plants and industries that combust coal and oil; as such, the highest levels of SO_2 are generally found near large industrial complexes. In recent years, SO_2 concentrations have been reduced by the increasingly stringent controls placed on stationary source emissions of SO_2 and limits placed on the sulfur content of fuels. SO_2 is an irritant gas that attacks the throat and lungs and can cause acute respiratory symptoms and diminished ventilator function in children. SO_2 can also yellow plant leaves and erode iron and steel.

Particulate Matter (PM_{10} and $PM_{2.5}$)

PM pollution consists of very small liquid and solid particles, which can include smoke, soot, dust, salts, acids, and metals. PM can be emitted directly or can form when gases emitted from industries and motor vehicles undergo chemical reactions in the atmosphere. $PM_{2.5}$ and PM_{10} represent fractions of particulate matter. Fine particulate matter, or $PM_{2.5}$, is roughly 1/28 the diameter of a human hair. $PM_{2.5}$ results from fuel combustion (e.g., motor vehicles, power generation, and industrial facilities), residential fireplaces, and woodstoves. In addition, $PM_{2.5}$ can be formed in the atmosphere from gases such as sulfur oxides (SO_x), NO_x, and VOCs. Inhalable or coarse particulate matter, or PM_{10}, is about one-seventh the thickness of a human hair. Major sources of PM_{10} include crushing or grinding operations; dust stirred up by vehicles traveling on roads; wood-burning stoves and fireplaces; dust from construction, landfills, and agriculture; wildfires and brush/waste burning; industrial sources; windblown dust from open lands; and atmospheric chemical and photochemical reactions.

$PM_{2.5}$ and PM_{10} pose a greater health risk than larger-size particles. When inhaled, these tiny particles can penetrate the human respiratory system's natural defenses and damage the respiratory tract. $PM_{2.5}$ and PM_{10} can increase the number and severity of asthma attacks, cause or aggravate bronchitis and other lung diseases, and reduce the body's ability to fight infections. Very small particles of substances such as lead, sulfates, and nitrates can cause lung damage directly or be absorbed into the bloodstream, causing damage elsewhere in the body. Additionally, these substances can transport absorbed gases, such as chlorides or ammonium, into the lungs, also causing injury. Whereas PM_{10} tends to collect in the upper portion of the respiratory system, $PM_{2.5}$ is so tiny that it can penetrate deeper into the lungs and damage lung tissues. Suspended particulates also damage and discolor surfaces on which they settle, as well as produce haze and reduce regional visibility.

Lead

Lead in the atmosphere occurs as PM. Key sources of lead include the manufacturing of batteries, paint, ink, ceramics, ammunition, and secondary lead smelters. Prior to 1978, mobile emissions were the primary source of atmospheric lead. Between 1978 and 1987, the phase-out of leaded gasoline reduced the overall inventory of airborne lead by nearly 95 percent. With the phase-out of leaded gasoline, secondary lead smelters, battery recycling, and manufacturing facilities are lead-emission sources of greater concern.

Prolonged exposure to atmospheric lead poses a serious threat to human health. Health effects associated with exposure to lead include gastrointestinal disturbances, anemia, kidney disease, and in severe cases, neuromuscular and neurological dysfunction. Of particular concern are low-level lead exposures during infancy and childhood. Such exposures are associated with decreases in neurobehavioral performance, including intelligence quotient performance, psychomotor performance, reaction time, and growth.

Sulfates

Sulfates are the fully oxidized form of sulfur, which typically occur in combination with metals or hydrogen ions. Sulfates are produced from reactions of SO_2 in the atmosphere. Sulfates can result in respiratory impairment, as well as reduced visibility.

Vinyl Chloride

Vinyl chloride is a colorless gas with a mild, sweet odor. It has been detected near landfills, sewage plants, and hazardous waste sites, due to the microbial breakdown of chlorinated solvents. Short-term exposure to high levels of vinyl chloride in air can cause nervous system effects, such as dizziness, drowsiness, and headaches. Long-term exposure through inhalation can cause liver damage, including liver cancer.

Hydrogen Sulfide

Hydrogen sulfide is a colorless and flammable gas that has a characteristic odor of rotten eggs. Sources of hydrogen sulfide include geothermal power plants, petroleum refineries, sewers, and sewage treatment plants. Exposure to hydrogen sulfide can result in nuisance odors, as well as headaches and breathing difficulties at higher concentrations.

Visibility-Reducing Particles

Visibility-reducing particles are any particles in the air that obstruct the range of visibility. Effects of reduced visibility can include obscuring the viewshed of natural scenery, reduced airport safety, and discouraging tourism. Sources of visibility-reducing particles are the same as for $PM_{2.5}$ described above.

Legend : VOC = volatile organic compounds; NO_x = nitrogen oxides; CO = carbon monoxide; SO_x = sulfur oxides; PM_{10} = particulate matter less than 10 microns in diameter; $PM_{2.5}$ = particulate matter less than 2.5 microns in diameter; ton/yr = tons per year.

Notes : [1]Annual VOC evaporative emissions from architectural coating were manually distributed evenly from 2028-2049.

[2]Haul Trucks and Vendor Trips are both classified as Truck Trips in the EIS tables.

Legend : VOC = volatile organic compounds; NO_x = nitrogen oxides; CO = carbon monoxide; SO_x = sulfur oxides; PM_{10} = particulate matter less than 10 microns in diameter; $PM_{2.5}$ = particulate matter less than 2.5 microns in diameter; ton/yr = tons per year.

Notes : (1) Annual VOC evaporative emissions from architectural coating were manually distributed evenly from 2028-2049.

(2) Haul Trucks and Vendor Trips are both classified as Truck Trips in the EIS tables.

Legend : VOC = volatile organic compounds; NO_x = nitrogen oxides; CO = carbon monoxide; SO_x = sulfur oxides; PM_{10} = particulate matter less than 10 microns in diameter; $PM_{2.5}$ = particulate matter less than 2.5 microns in diameter; ton/yr = tons per year.

Notes : [1]Annual VOC evaporative emissions from architectural coating were manually distributed evenly from 2028-2049.

[2]Haul Trucks and Vendor Trips are both classified as Truck Trips in the EIS tables.

Table D-A1.1-6 Annual Construction Emissions by Source Category and Phase, Alternative 5, Private Development

Source Category [1][2]	*Construction Phase*	*Year*	*VOC (ton/yr)*	*NO_x (ton/yr)*	*CO (ton/yr)*	*SO_x (ton/yr)*	*Fugitive PM_{10} (ton/yr)*	*Exhaust PM_{10} (ton/yr)*	*PM_{10} (ton/yr)*	*Fugitive $PM_{2.5}$ (ton/yr)*	*Exhaust $PM_{2.5}$ (ton/yr)*	*$PM_{2.5}$ (ton/yr)*

Legend : VOC = volatile organic compounds; NO_x = nitrogen oxides; CO = carbon monoxide; SO_x = sulfur oxides; PM_{10} = particulate matter less than 10 microns in diameter; $PM_{2.5}$ = particulate matter less than 2.5 microns in diameter; ton/yr = tons per year.

Notes : [1]Annual VOC evaporative emissions from architectural coating were manually distributed evenly from 2028-2049.

[2]Haul Trucks and Vendor Trips are both classified as Truck Trips in the EIS tables.

Legend : VOC = volatile organic compounds; NO_x = nitrogen oxides; CO = carbon monoxide; SO_x = sulfur oxides; PM_{10} = particulate matter less than 10 microns in diameter; $PM_{2.5}$ = particulate matter less than 2.5 microns in diameter; ton/yr = tons per year; lb/day = pounds per day.

Notes : [(1)]Emissions were calculated in CalEEMod. The sources subject to the Tier 4 measure that were modeled in CalEEMod are 4 diesel forklifts operating 8 hr/day and 260 days per year, and 1 diesel generator set operating 2 hr/day and 260 days per year. CalEEMod default horsepower and load factors were modeled.

[(2)]Although the equipment is for operations, they were modeled in CalEEMod as construction equipment to quantify the effectiveness of the Tier 4 measure.

[(3)]The emissions change is added to the CalEEMod output.

Emissions with default engine tiers	0.0867	0.4681	1.1911	0.0019	0.0050	0.0050
Emissions with Tier 4 engines	0.0188	0.0816	1.1616	0.0019	0.0025	0.0025
Emissions Change	**-0.0679**	**-0.3865**	**-0.0295**	**0.0000**	**-0.0025**	**-0.0025**

Legend : VOC = volatile organic compounds; NO_x = nitrogen oxides; CO = carbon monoxide; SO_x = sulfur oxides; PM_{10} = particulate matter less than 10 microns in diameter; $PM_{2.5}$ = particulate matter less than 2.5 microns in diameter; ton/yr = tons per year; lb/day = pounds per day.

Notes : (1)Emissions were calculated in CalEEMod. The source subject to the Tier 4 measure that was modeled in CalEEMod consists of 1 diesel forklift operating 8 hours per day and 260 days per year. CalEEMod default horsepower and load factor were modeled.

(2)Although the equipment is for operations, it was modeled in CalEEMod as construction equipment to quantify the effectiveness of the Tier 4 measure.

(3)The emissions change is added to the CalEEMod output.

Legend : VOC = volatile organic compounds; NO_x = nitrogen oxides; CO = carbon monoxide; SO_x = sulfur oxides; PM_{10} = particulate matter less than 10 microns in diameter; $PM_{2.5}$ = particulate matter less than 2.5 microns in diameter; lb/day = pounds per day.

Notes : [1]Daily VOC evaporative emissions from architectural coating were interpolated from 2028-2049.

[2]Haul Trucks and Vendor Trips are both classified as Truck Trips in the EIS tables.

Legend : VOC = volatile organic compounds; NO_x = nitrogen oxides; CO = carbon monoxide; SO_x = sulfur oxides; PM_{10} = particulate matter less than 10 microns in diameter; $PM_{2.5}$ = particulate matter less than 2.5 microns in diameter; lb/day = pounds per day.

Notes : (1) Daily VOC evaporative emissions from architectural coating were interpolated from 2028-2049.

(2) Haul Trucks and Vendor Trips are both classified as Truck Trips in the EIS tables.

Legend : VOC = volatile organic compounds; NOx = nitrogen oxides; CO = carbon monoxide; SOx = sulfur oxides; PM10 = particulate matter less than 10 microns in diameter; PM2.5 = particulate matter less than 2.5 microns in diameter; lb/day = pounds per day.

Notes : [(1)]Navy development construction would occur 2021-2025. Private development construction would occur 2026-2049.

[(2)]For Navy construction, this table presents the maximum emission rate from the following sets of overlapping phases: (a) demolition and site preparation; (b) grading and foundation drilling; (c) foundation drilling and building construction; (d) grading and building construction; (e) building construction and paving; and (f) building construction and architectural coating.

[(3)]For Private construction, this table presents the maximum emission rate from the following sets of overlapping phases: (a) demolition and site preparation ; (b) grading, foundation drilling, and building construction; (c) building construction and paving; and (d) building construction and architectural coating.

Legend : VOC = volatile organic compounds; NO_x = nitrogen oxides; CO = carbon monoxide; SO_x = sulfur oxides; PM_{10} = particulate matter less than 10 microns in diameter; $PM_{2.5}$ = particulate matter less than 2.5 microns in diameter; lb/day = pounds per day.

Notes : [(1)]Navy development construction would occur 2021-2025. Private development construction would occur 2026-2049.

[(2)]For Navy construction, this table presents the maximum emission rate from the following sets of overlapping phases: (a) demolition and site preparation; (b) grading and foundation drilling; (c) foundation drilling and building construction; (d) grading and building construction; (e) building construction and paving; and (f) building construction and architectural coating.

[(3)]For Private construction, this table presents the maximum emission rate from the following sets of overlapping phases: (a) demolition and site preparation ; (b) grading, foundation drilling, and building construction; (c) building construction and paving; and (d) building construction and architectural coating.

Table D-A1.3-6 Emissions Adjustment for Construction Daily VOC, Alternative 4 with Mitigation

Legend : VOC = volatile organic compounds; NO_x = nitrogen oxides; CO = carbon monoxide; SO_x = sulfur oxides; PM_{10} = particulate matter less than 10 microns in diameter; $PM_{2.5}$ = particulate matter less than 2.5 microns in diameter; lb/day = pounds per day.

Notes : (1)Landscaping emissions were calculated outside of CalEEMod.

(2)Emissions from transit center vehicle trips are presented in a separate table and therefore are not included here.

Table D-A1.4-5 Maximum Daily Operational Emissions Interpolated by Year, Alternatives 2 through 5, Navy Development

Year [(1)]	*VOC (lb/day)*	*NO_x (lb/day)*	*CO (lb/day)*	*SO_x (lb/day)*	*PM_{10} (lb/day)*	*$PM_{2.5}$ (lb/day)*

Attachment 3.1

RONA Documentation

This page intentionally left blank.

RECORD OF NON-APPLICABILITY (RONA) FOR CLEAN AIR ACT CONFORMITY NAVY OLD TOWN CAMPUS REVITALIZATION

The Proposed Action falls under the Record of Non-Applicability (RONA) category and is documented with this RONA.

Introduction

The U.S. Environmental Protection Agency (USEPA) published *Determining Conformity of General Federal Actions to State or Federal Implementation Plans*; Final Rule, in the 30 November 1993 Federal Register (FR) (40 Code of Federal Regulations [CFR] §§ 6, 51, and 93). On 5 April 2010, the USEPA finalized revisions to the General Conformity Rule (75 FR 17253–17279). The U.S. Department of the Navy (Navy) published Navy Guidance for Compliance with the Clean Air Act (CAA) General Conformity Rule (30 July 2013), as referenced in Chief of Naval Operations Instruction 5090.1E, Environmental Readiness Program Manual dated 3 Sept 2019 (Department of the Navy, 2019). These publications provide implementing guidance to document CAA conformity determination requirements. This RONA is provided to document compliance of the Proposed Action.

Federal regulations state that “no department, agency, or instrumentality of the Federal Government shall engage in, support in any way or provide financial assistance for, license or permit, or approve any activity that does not conform to an applicable State Implementation Plan (SIP).” It is the responsibility of the federal agency to determine whether a federal action conforms to the applicable SIP before the action is taken (40 CFR § 51.850[a]).

Federal actions may be exempt from conformity determinations if their emissions do not exceed designated *de minimis* levels for the criteria pollutants of nonattainment or maintenance in the areas of the federal action (40 CFR § 51.853[b]). The most stringent *de minimis* thresholds for the San Diego Air Basin (SDAB), which encompasses the region affected by the Proposed Action, are 50 tons per year of VOCs or NO_x, based on the current serious ozone nonattainment classification, as presented in Table 1.

In October 2020, the San Diego Air Pollution Control District (SDAPCD) Board approved the *Final 2020 Plan for Attaining the National Ozone Standards* (*2020 Ozone Plan*) (SDAPCD, 2020). In this plan, the SDAPCD requests that the USEPA re-designate the SDAB to severe nonattainment areas for both the 2008 and 2015 ozone national ambient air quality standards (NAAQS) to allow more time to bring the region into attainment of these standards. The California Air Resources Board (CARB) approved the *2020 Ozone Plan* on November 19, 2020 (CARB, 2020) and submitted it to the USEPA on January 8, 2021 for consideration as a revision to the California SIP for attaining the ozone standards. It is reasonably foreseeable that the USEPA will approve the *2020 Ozone Plan* within the 18-month period required by the Clean Air Act (review period began January 8, 2021). Therefore, the conformity applicability analysis of the Proposed Action relies on the conformity *de minimis* thresholds that pertains to a severe ozone nonattainment classification of 25 tons per year of VOCs or NO_x, as shown in Table 1. The project NEPA team obtained concurrence of this approach from Navy Legal on 4 March 2021.

Table 1. Applicable *de minimis* Levels of Nonattainment Criteria Pollutants for the SDAB

Pollutant	*Area Nonattainment Designation*	*De minimis Threshold (tpy)*
Ozone (VOC or NO_x)	Severe nonattainment	25
Ozone (VOC or NO_x)	Serious nonattainment	50

Source: 40 CFR § 93; Navy, 2013.
Legend: NO_x = nitrogen oxides; tpy = tons per year; VOC = volatile organic compounds.

Proposed Action

Action Proponent: Naval Information Warfare Systems Command

Location: Naval Base Point Loma Old Town Campus, California

Proposed Action Name: Navy Old Town Campus Revitalization

Proposed Action and Emissions Summary:

The Proposed Action would modernize the Naval Base Point Loma Old Town Campus (OTC) in San Diego, California, through demolition, construction, and renovation of buildings, utilities, and infrastructure to support the operational mission of Naval Information Warfare Systems Command (NAVWAR). The purpose and need for the Proposed Action could be achieved (1) through Navy redevelopment alone or (2) in collaboration with private developers to fund NAVWAR redevelopment on OTC through mixed-use redevelopment on other parts of the OTC property. Therefore, the conformity applicability analysis of the Proposed Action included evaluation of (1) Alternative 1 (NAVWAR-Only Redevelopment) and (2) Alternative 4 (Public-Private Redevelopment–NAVWAR and Higher Density Mixed Use with a Transit Center), as defined in the project Environmental Impact Statement (EIS).

The analysis evaluated the following construction timelines:

- For Alternatives 1 and 4, construction of the Navy development would occur from 2021 through 2025.
- For Alternative 4, construction of the private development (mixed-use, such as residential, office, retail, and hotel land uses) would occur from 2026 through 2049. Alternative 1 would not construct any private development.
- For Alternative 4, construction of a transit center to provide a direct connection to the regional mass transit network would occur from 2026 through 2034. Alternative 1 would not construct a transit center.

Full operation of OTC and the Navy facilities would begin in 2026 for both Alternatives 1 and 4. For Alternative 4, the analysis evaluated operation of private development according to the following sequence:

- For 2026, 0 percent occupancy and no operation.
- For 2030, operation at 25 percent occupancy.
- For 2035, operation at 45 percent occupancy.
- For 2050, operation at 100 percent occupancy.

Operation of Alternatives 1 and 4 would produce air emissions from the following sources:

- On-road vehicle traffic generated by the land uses. The analysis obtained vehicle trip rates and lengths developed in the EIS traffic study to assist in the estimation of vehicular emissions.

- Use of consumer products such as cleaning supplies, kitchen aerosols, cosmetics, toiletries, parking lot degreasers, fertilizers, and pesticides (VOC only).
- Architectural coating activities from periodic re-painting of buildings and parking lots (VOC only).
- Navy industrial equipment such as forklifts, onsite utility vehicles, and standby diesel generators.
- Landscaping equipment.
- Natural gas use in buildings.

The analysis also estimated emissions from operation of the No Action Alternative for the same analysis years as Alternatives 1 and 4. For all analysis years, the No Action Alternative would have the same land uses and number of vehicle trips as the existing conditions scenario for OTC (year 2020). The No Action Alternative served as the baseline for the evaluation of emissions from Alternatives 1 and 4. Therefore, the net changes in annual emissions that would result from a proposed alternative (i.e., proposed alternative minus the No Action Alternative) were compared to the emission *de minimis* thresholds to determine compliance of each alternative with the General Conformity Rule.

The air quality analysis used CalEEMod version 2016.3.2 to quantify air emissions from proposed construction and operations activities (California Air Pollution Control Officers Association, 2016). CalEEMod is a statewide program designed to calculate both construction and operational emissions from land use development projects in California. CalEEMod uses widely accepted emission calculation methods combined with default data that can be used if site-specific information is not available. The analysis of Alternative 4 combined overlapping construction and operational emissions to produce total annual emissions. As required by the General Conformity Rule, the analysis estimated annual emissions for the following scenarios for each proposed alternative:

- The attainment years specified in the SIP (*2020 Ozone Plan*) – 2026 and 2032
- Any year that the applicable SIP specifies an emissions budget – 2023, 2026, 2029, and 2032
- The year with the greatest annual project emissions
- The project horizon year – 2050

The conformity applicability analysis excluded certain indirect emissions evaluated in the EIS analysis, as the Navy determined that (1) these emissions would not be practicably controllable and (2) the Navy would not have continuing program responsibility over them. The indirect emissions excluded from the analysis would occur from the following sources:

- Construction emissions from (1) offsite worker commuter vehicle trips and (2) offsite truck trips, except outbound one-way trips for hauling debris or soil offsite.
- Operational emissions from private development.
- Construction and operational sources that would require an air permit.

Based on the analysis of Alternatives 1 and 4, the maximum estimated emissions of applicable pollutants would be below the conformity *de minimis* levels for the SDAB. Therefore, emissions from the Proposed Action would show conformity under the CAA. The estimated annual conformity emissions and applicable conformity *de minimis* levels for Alternatives 1 and 4 are shown in Tables 2 and 3, respectively. Attachment 3.1 to this RONA presents the supporting emission calculations for the conformity applicability analysis.

Table 2. Estimated Annual Air Pollutant Emissions of Alternative 1 within the SDAB (tons/year)

Year/Source Category	*VOC*	*NO_x*
Year 2023(1)	-	-
Alternative 1 Construction	**0.15**	**0.78**
***De Minimis* Thresholds**	**25**	**25**
Exceeds Threshold?	**No**	**No**
Year 2026(2)	-	-
Alternative 1 Operations	7.27	6.91
No Action Alternative	5.63	6.58
Alternative 1 Net Change(3)	**1.65**	**0.33**
***De Minimis* Thresholds**	**25**	**25**
Exceeds Threshold?	**No**	**No**
Year 2029	-	-
Alternative 1 Operations	7.12	6.25
No Action Alternative	5.49	5.82
Alternative 1 Net Change	**1.63**	**0.43**
***De Minimis* Thresholds**	**25**	**25**
Exceeds Threshold?	**No**	**No**
Year 2032	-	-
Alternative 1 Operations	7.00	5.89
No Action Alternative	5.38	5.43
Alternative 1 Net Change	**1.62**	**0.45**
***De Minimis* Thresholds**	**25**	**25**
Exceeds Threshold?	**No**	**No**
Year 2050	-	-
Alternative 1 Operations	6.69	5.46
No Action Alternative	5.10	5.03
Alternative 1 Net Change	**1.59**	**0.42**
***De Minimis* Thresholds**	**25**	**25**
Exceeds Threshold?	**No**	**No**
Maximum Year(4)	-	-
Alternative 1 Construction	4.87	1.71
Alternative 1 Operations	--	--
Alternative 1 Total	--	--
No Action Alternative	--	--
Alternative 1 Net Change	**4.87**	**1.71**
***De Minimis* Thresholds**	**25**	**25**
Exceeds Threshold?	**No**	**No**

Legend: -- = not applicable; - = no data; NO_x = nitrogen oxides; VOC = volatile organic compounds.

Notes: (1) Assumes no net change in operational emissions prior to 2026. Therefore, 2023 construction emissions were compared directly to the de minimis thresholds.

(2) Assumes no construction beyond 2025.

(3) Net change = Alternative 1 Total minus No Action Alternative.

(4) The maximum years would be 2025 for VOC and 2021 for NO_x, which only includes construction.

Table 3. Estimated Annual Air Pollutant Emissions of Alternative 4 within the SDAB (tons/year)

Year/Source Category	*VOC*	*NO_x*
Year 2023[1]	-	-
Alternative 4 Construction	**0.29**	**1.39**
***De Minimis* Thresholds**	**25**	**25**
Exceeds Threshold?	**No**	**No**
Year 2026	-	-
Alternative 4 Construction	0.40	2.93
Alternative 4 Operations	4.40	4.05
Alternative 4 Total	**4.80**	**6.98**
No Action Alternative	5.63	6.58
Alternative 4 Net Change[2]	**(0.83)**	**0.41**
***De Minimis* Thresholds**	**25**	**25**
Exceeds Threshold?	**No**	**No**
Year 2029	-	-
Alternative 4 Construction	2.57	2.70
Alternative 4 Operations	4.32	3.73
Alternative 4 Total	**6.89**	**6.44**
No Action Alternative	5.49	5.82
Alternative 4 Net Change	**1.40**	**0.62**
***De Minimis* Thresholds**	**25**	**25**
Exceeds Threshold?	**No**	**No**
Year 2032	-	-
Alternative 4 Construction	2.56	2.97
Alternative 4 Operations	4.25	3.55
Alternative 4 Total	**6.81**	**6.52**
No Action Alternative	5.38	5.43
Alternative 4 Net Change	**1.43**	**1.09**
***De Minimis* Thresholds**	**25**	**25**
Exceeds Threshold?	**No**	**No**
Year 2050[3]	-	-
Alternative 4 Operations	**4.08**	**3.31**
No Action Alternative	5.10	5.03
Alternative 4 Net Change	**(1.02)**	**(1.72)**
***De Minimis* Thresholds**	**25**	**25**
Exceeds Threshold?	**No**	**No**
Maximum Year[4]	-	-
Alternative 4 Construction	3.41	1.88
Alternative 4 Operations	--	--
Alternative 4 Total	--	--
No Action Alternative	--	--
Alternative 4 Net Change	**3.41**	**1.88**
***De Minimis* Thresholds**	**25**	**25**
Exceeds Threshold?	**No**	**No**

Legend: -- = not applicable; - = no data; NO_x = nitrogen oxides; VOC = volatile organic compounds.

Notes: (1) Assumes no net change in operational emissions prior to 2026. Therefore, 2023 construction emissions were compared directly to the de minimis thresholds.

(2) Net change = Alternative 4 Total minus No Action Alternative.

(3) Assumes there would be no construction in 2050.

(4) The maximum years would be 2025 for VOC and 2021 for NOx, which only includes construction.

<u>Affected Air Basin:</u> San Diego Air Basin

<u>Date RONA Prepared:</u> April 2021

<u>RONA Prepared by</u>: Leidos Corporation

Proposed Action Exemption(s)

The Proposed Action is exempt from General Conformity Rule requirements, based on the determination that emissions associated with the Proposed Action at OTC are below all *de minimis* thresholds.

Attainment Area Status and Emissions Evaluation Conclusion

The Proposed Action would occur within the SDAB, which is the same geographic area as San Diego County. The USEPA currently classifies the SDAB as a serious nonattainment for the ozone NAAQS. The SDAB is in attainment of the NAAQS for all other criteria pollutants. Therefore, only project emissions of ozone (or its precursors, volatile organic compounds [VOCs] and oxides of nitrogen [NO_x]) were analyzed in reference for conformity rule applicability. The applicable *de minimis* threshold levels for this region are 50 tons of VOC and NO_x. However, it is reasonably foreseeable that the USEPA will re-designate the SDAB to severe ozone nonattainment by July 8, 2022. Therefore, the conformity applicability analysis of the Proposed Action relies on the conformity *de minimis* thresholds of 25 tons per year of VOCs or NO_x that pertain to a severe ozone nonattainment classification. The Navy concludes that the conformity *de minimis* levels for applicable criteria pollutants would not be exceeded as a result of implementing the Proposed Action. Therefore, the Proposed Action is exempt from a formal conformity determination. The Navy concludes that further formal conformity determination procedures are not required, resulting in this RONA.

OTC2PRIV	61,350	0.10	21.20	0.00	0.02	21.22
OTC2NAVY	32,604	0.06	0.00	0.00	0.00	0.00
Maximum Year of Emissions During Private Construction (for Chronic Hazard Index)						
OTC1	193,165	0.20	112.13	0.06	0.17	112.36
OTC2PRIV	61,350	0.10	35.61	0.01	0.03	35.65
OTC2NAVY	32,604	0.06	0.00	0.00	0.00	0.00

Legend : m^2 = square meters; mi = miles; lb/yr = pounds per year; 3TM = third trimester (before birth).

Notes : (1) Source areas are from AERMOD.

(2) Assume the average on-site one-way truck travel distance is equal to one-half of the average distance across the area source.

(3) Emissions from OTC1 and OTC2PRIV were apportioned from the private development emissions by relative surface area.

(4) On-site truck emissions were scaled from the total (on-site and off-site) truck emissions by the ratio of on-site to total one-way travel distance. Total one-way travel distances (from CalEEMod) were 20 miles for haul trucks and 7.3 miles for vendor trips.

Table D-A4.1-14 Annual Average On-Site Construction DPM Emissions by AERMOD Source, Alternative 5; Scenario C
Scenario C: Exposure Period Begins in Year 2 of Private Development Construction (2027)

AERMOD Source	*Polygon Source Area (m^2) (1)*	*On-Site One-Way Truck Travel Distance (mi) (2)*	*Off-Road Equipment Emissions (lb/yr) (3)*	*Haul Truck Emissions (lb/yr) (3)(4)*	*Vendor Trip Emissions (lb/yr) (3)(4)*	*Total Annual Average Emissions (lb/yr)*

Legend : Rec = receptor; UTM = universe transverse mercator coordinates; m = meter; HARP = hot spots analysis & reporting program; 3TM = third trimester before birth.

Notes : (1)Unless otherwise noted, all sensitive receptors were conservatively modeled with 30-year residential exposure assumptions (the same as residential receptors).

(2)Infant exposure at the birth center would be brief, so assume 25-year worker exposure conditions.

(3)Cancer risk at Veteran's Village assumes continuous exposure during the third trimester before birth and the first two years after birth.

Legend : Rec = receptor; UTM = universe transverse mercator coordinates; m = meter; HARP = hot spots analysis & reporting program; 3TM = third trimester before birth.

Notes : (1) Unless otherwise noted, all sensitive receptors were conservatively modeled with 30-year residential exposure assumptions (the same as residential receptors).

(2) Infant exposure at the birth center would be brief, so assume 25-year worker exposure conditions.

(3) Cancer risk at Veteran's Village assumes continuous exposure during the third trimester before birth and the first two years after birth.

Legend : Rec = receptor; UTM = universe transverse mercator coordinates; m = meter; HARP = hot spots analysis & reporting program; 3TM = third trimester before birth.

Notes : [(1)]Population data are provided by HARP and are from the 2010 U.S. Census.

[(2)]The 70-year cancer risk is the same as the 30-year cancer risk because the construction period would fit entirely within the 30-year residential exposure period.

[(3)]Cancer burden = population x cancer risk.

Table D-A4.5-2 Cancer Burden Calculations, Alternative 5

						HARP Output, Exposure Scenario A			HARP Output, Exposure Scenario B			HARP Output, Exposure Scenario C			Cancer Burden Calculation

Legend : Rec = receptor; UTM = universe transverse mercator coordinates; m = meter; HARP = hot spots analysis & reporting program; 3TM = third trimester before birth.

Notes : [(1)]Population data are provided by HARP and are from the 2010 U.S. Census.

[(2)]The 70-year cancer risk is the same as the 30-year cancer risk because the construction period would fit entirely within the 30-year residential exposure period.

[(3)]Cancer burden = population x cancer risk.

EXECUTIVE SUMMARY

Linscott, Law & Greenspan, Engineers (LLG) has prepared the following Transportation Impact Analysis associated with the Navy Revitalization Old Town Campus (OTC) Propose Action alternatives (hereby referred to as the "Proposed Action" or "Proposed Action alternatives"). NAVWAR proposes to revitalize NAVBASE Point Loma's OTC, which would include the construction of buildings, utilities, and infrastructure to provide mission capable facilities for NAVWAR and other tenant commands on OTC. Revitalization efforts could include Navy recapitalization of the site or redevelopment through a public-private partnership.

The Proposed Action is located north of downtown San Diego and south of Old Town San Diego, approximately 1/2-mile north of San Diego International Airport. The neighborhood of Mission Hills is located to the east and the Midway District and Liberty Station is located to the west. The Old Town Transit Center, an intermodal transportation station providing local bus and trolley service, commuter rail service, and regional rail service, is located approximately 400 feet north of the site. OTC comprises two sites totaling 70.5 acres: OTC Site 1 is 48.7 acres and OTC Site 2 is 21.8 acres. OTC Site 1 is bordered by Pacific Highway to the west, Interstate 5 to the north and east, a railroad right-of-way to the east, and Barnett Avenue to the south. OTC Site 2 is adjacent to OTC Site 1 to the west. OTC Site 2 is bordered by Midway Drive to the west, Rosecrans Street to the North, Pacific Highway to the east, and Barnett Avenue to the south.

The Proposed Action would revitalize OTC through demolition and construction of buildings, utilities, and infrastructure to provide secure, safe, modern state-of-the-art facilities to meet NAVWAR's operational mission. The revitalization of OTC may be accomplished through Navy recapitalization or a number of public-private development scenarios. Through the alternative development process, five action alternatives were identified that meet the purpose and need for the Proposed Action. One action alternative analyzes recapitalization of OTC with Navy funds, and four action alternatives analyze revitalization of OTC with various densities in collaboration with a private developer.

In addition to the No Action alternative, the following five action alternatives were analyzed in this report:

- Alternative 1: Navy Recapitalization at OTC
- Alternative 2: Higher-density Mixed-use Revitalization
- Alternative 3: Lower-density Mixed-use Revitalization
- Alternative 4: Higher-density Mixed-use Revitalization including a Transit Center
- Alternative 5: Lower-density Mixed-use Revitalization including a Transit Center

LLG, Engineers has prepared this Transportation Impact Analysis as part of the planning process complying with both the National Environmental Protection Act (NEPA) and the local California Environmental Quality Act (CEQA). This report analyzes the impacts from the Proposed Action alternatives based on Level of Service and Vehicle Miles Traveled (VMT), pursuant to California Senate Bill (SB) 743.

For the cumulative impact analysis presented in this report, the Year 2050 analysis represents the cumulative condition when the Proposed Action alternatives would be fully operational over the buildout ambient traffic conditions. Direct impacts from the Proposed Action alternatives were evaluated assuming the most intensive development that would be expected to occur within a 10-year timeframe, by Year 2030.

Using City of San Diego trip generation rates, the vehicular traffic expected to be generated by each Proposed Action alternative is shown in ***Table ES–1***:

TABLE ES–1
TRIP GENERATION SUMMARY

Proposed Action Alternative	**ADT**	**AM Peak Hour**			**PM Peak Hour**		
		In	Out	Total	In	Out	Total
Alternative 1	800	65	7	72	8	72	80
Alternative 2	51,946	1,583	2,472	4,055	2,909	2,150	5,059
Alternative 3	34,592	1,044	1,648	2,692	1,959	1,429	3,388
Alternative 4	70,022	1,904	3,253	5,157	3,786	2,690	6,476
Alternative 5	55,309	1,406	2,610	4,016	3,039	2,031	5,070
Year 2030 Alternative 2 (25%) *(worst-case highest intensity development)*	11,951	338	612	950	732	461	1,193

General Notes:

1. *Section 7.1* of this report provides the land use quantities, trip generation rates, and complete trip generation calculations for each Proposed Action alternative.
2. For the Year 2030 analysis, 25% of Alternative 2 was assumed.

The Year 2050 conditions represent a future baseline with the effects of cumulative development over the existing on-the-ground conditions without development of the Proposed Action alternative. This condition is considered the Year 2050 No-Action Alternative as it assumed the existing NAVWAR operations would continue into the future and is used to measure the Proposed Action's cumulative impacts. The Year 2050 No-Action Alternative parameters were developed over several months through the coordination of WSP Global Inc. and SANDAG. Several outside influencing factors were considered for inclusion in the forecast Year 2050. WSP and SANDAG worked with local agencies and reviewed individual cumulative development projects, Community Plans, Specific Plans, Master Plans, and Development Plans for the surrounding area.

An interim near-term condition is analyzed in this report to evaluate direct impacts. The Year 2030 assumes the most intense land use development and resulting trip generation (without the transit center) that could partially develop within a 10-year timeframe.

Intersections, street segments, freeway segments, and ramp meters were analyzed for the auto delay/level of service (LOS) analysis contained in this report. All locations were analyzed under the following 10 scenarios:

- Existing (Year 2020)
- Year 2050 No-Action Alternative
- Year 2050 with No-Action Alternative including an Automated Passenger Mover
- Year 2050 with Alternative 1: Navy Recapitalization at OTC
- Year 2050 with Alternative 2: Higher-density Mixed-use Revitalization
- Year 2050 with Alternative 3: Lower-density Mixed-use Revitalization
- Year 2050 with Alternative 4: Higher-density Mixed-use Revitalization including a Transit Center
- Year 2050 with Alternative 5: Lower-density Mixed-use Revitalization including a Transit Center
- Near-Term Year 2030
- Near-Term with Year 2030 Alternative 2: Higher-density Mixed-use Revitalization (25%) – *representing the worst-case highest intensity development to occur in a 10-year timeframe*

The auto delay/LOS analysis performed for the above scenarios results in significant impacts at study area locations. ***Table ES–2*** at the end of this summary provides a list of the impacted locations.

An analysis of the active transportation modes is provided in this report to evaluate the non-vehicular modes of transportation around the OTC site. Under Alternatives 4 and 5, the Old Town Transit Center is relocated to within the OTC. Various improvements to pedestrian, bicycle and transit modes are recommended. ***Table ES–3*** at the end of this summary provides a list of the recommended active transportation improvements.

A VMT analysis was also conducted consistent with the California Governor's Office of Planning and Research (OPR) guidelines to implement California State Law SB 743. At the time this report was prepared, the City of San Diego was in the process of developing their draft guidelines for VMT. The VMT analysis provided in this report concludes no significant VMT impacts would occur with development of the Proposed Action alternatives.

Preparation of a Transportation Demand Management (TDM) Plan and participation in the implementation of Transportation Systems Management (TSM) measures are proposed in this report as partial mitigation at locations with significant and unavoidable impacts.

Table ES–2
Significant Impact Summary

Location	Jurisdiction	Year 2050 Cumulative Impacts										Year 2030 Direct Impacts	
		Alternative 1	Mitigated? (Y/N)	Alternative 2	Mitigated? (Y/N)	Alternative 3	Mitigated? (Y/N)	Alternative 4	Mitigated? (Y/N)	Alternative 5	Mitigated? (Y/N)	Alternative 2 (25%)	Mitigated? (Y/N)

TABLE ES–3
ACTIVE TRANSPORTATION IMPROVEMENTS SUMMARY

ID	Location	Recommended Improvement
PEDESTRIAN NETWORK		
Tier 1 Pedestrian Improvements – *The following improvements shall be implemented as mitigation:*		
P-1.	Pacific Highway, between Old Town Transit Center Driveway and Witherby Street	Upgrade the sidewalk classification on the east side of Pacific Highway, between Old Town Transit Center Driveway and Witherby Street to a corridor sidewalk classification for Proposed Action alternatives 2 and 3 and district sidewalk classification for Proposed Action Alternative 4 and 5.
P-2.	Sports Arena Boulevard, between Rosecrans Street and Pacific Highway	Install missing sidewalks per connector sidewalk classification on both sides of Sports Arena Boulevard, between Rosecrans Street and Pacific Highway.
P-3.	Midway Drive, between Rosecrans Street and Barnett Avenue	Install missing sidewalks per connector or corridor sidewalk classifications on the north side of Midway Drive, between Rosecrans Street and Barnett Avenue.
P-4.	Witherby Street, between Pacific Highway and Hancock Street	Install missing sidewalks per connector sidewalk classification on the west side of Witherby Street, between Pacific Highway and Hancock Street.
P-5.	Sports Arena Boulevard / Rosecrans Street Intersection	Conduct a feasibility assessment of the pedestrian improvements shown in Figure 3-15 of the *Midway-Pacific Highway Community Plan*. A transportation impact was calculated at this study intersection therefore, all feasible pedestrian improvements should be implemented.
P-6.	Pacific Highway / Witherby Street Intersection	Conduct a feasibility assessment of the pedestrian improvements shown Figure 3-16 of the *Midway-Pacific Highway Community Plan*. A transportation impact was calculated at this study intersection therefore, all feasible pedestrian improvements should be implemented.
P-7.	Midway Drive / Enterprise Street Intersection	Conduct a feasibility assessment of the pedestrian improvements described in Page 13 of the *Midway-Pacific Impact Fee Study*. A transportation impact was calculated at this study intersection therefore, all feasible pedestrian improvements should be implemented.
(Continued on Next Page)		

TABLE ES–3
ACTIVE TRANSPORTATION IMPROVEMENTS SUMMARY

ID	Location	Recommended Improvement
(Continued from Previous Page)		
P-8.	Barnett Avenue / Midway Drive Intersection	Conduct a feasibility assessment of the pedestrian improvements shown in Figure 3-13 of the *Midway-Pacific Highway Community Plan*. A transportation impact was calculated at this study intersection therefore, all feasible pedestrian improvements should be implemented.
Tier 2 Pedestrian Improvements – *The following improvements should be considered:*		
P-9.	Hancock Street, between Old Town Avenue and approximately 440 feet east of Witherby Street.	Install missing sidewalks per connector sidewalk classification on both sides of Hancock Street, between Old Town Avenue and approximately 440 feet east of Witherby Street.
P-10.	Pacific Highway, between Tripoli Avenue and approximately 280 feet west of W. Washington Street.	Install missing sidewalks per connector sidewalk classification on the south side of Pacific Highway, between Tripoli Avenue and approximately 280 feet west of W. Washington Street.
P-11.	Jessop Lane, between Enterprise Street and Barnett Avenue	Install missing sidewalks on both sides of Jessop Lane, between Enterprise Street and Barnett Avenue.
P-12.	Kurtz Street, between Rosecrans Street and Pacific Highway	Install missing sidewalks per connector sidewalk classification on both sides of Kurtz Street, between Rosecrans Street and Pacific Highway.
P-13.	Smith Street, between Pacific Highway and Kurtz Street	Install missing sidewalks on both sides of Smith Street, Between Pacific Highway and Kurtz Street.
P-14.	Old Town Transit Center Driveway	Install missing sidewalks on south side of Old Town Transit Center Driveway off Pacific Highway.
—	—	Prepare a Pedestrian Master Plan for the Proposed Action alternatives that will guide design and implementation of policies/programs to enhance access and mobility around and within the site for pedestrians of all ages and abilities.
(Continued on Next Page)		

TABLE ES–3
ACTIVE TRANSPORTATION IMPROVEMENTS SUMMARY

ID	Location	Recommended Improvement
(Continued from Previous Page)		
BICYCLE NETWORK		
Tier 1 Bicycle Improvements – *The following improvements shall be implemented as mitigation:*		
B-1.	Pacific Highway, between Old Town Transit Center Driveway and Witherby Street	Provide Class IV bicycle facilities consistent with the *Midway-Pacific Highway Community Plan*.
B-2.	Witherby Street, between Pacific Highway and Hancock Street	Provide Class II bicycle facilities consistent with the *Midway-Pacific Highway Community Plan*.
B-3.	Sports Arena Boulevard, between Rosecrans Street and Pacific Highway	Provide Class II bicycle facilities consistent with the *Midway-Pacific Highway Community Plan*.
B-4.	Midway Drive, between Rosecrans Street and Barnett Avenue	Provide Class I bicycle facilities consistent with the *Midway-Pacific Highway Community Plan*.
B-5.	Enterprise Street, between Pacific Highway and Midway Drive	Upgrade the bicycle classification from Class III to Class II.
Tier 2 Bicycle Improvements – *The following improvements should be considered:*		
B-6.	Taylor Street, between Kurtz Street and Presidio Drive	Provide Class II bicycle facilities consistent with the *Midway-Pacific Highway Community Plan* and the *Old Town Community Plan*.
B-7.	Juan Street, between Taylor Street and Witherby Street	Provide Class III bicycle facilities consistent with the *Old Town Community Plan.*
B-8.	Barnett Avenue, between Henderson Avenue and Midway Drive	Provide a Class II bicycle facility (south side only) consistent with the *Midway-Pacific Highway Community Plan*.
B-9.	Hancock Street, between Old Town Avenue to Noell Street	Provide a Class II bicycle facility consistent with the *Midway-Pacific Highway Community Plan*.
B-10.	Old Town Avenue, between Hancock Street and San Diego Avenue	Provide a Class II bicycle facility consistent with the *Midway-Pacific Highway Community Plan* and *Old Town Community Plan.*
(Continued on Next Page)		

Table ES–3
Active Transportation Improvements Summary

ID	Location	Recommended Improvement
(Continued from Previous Page)		
B-11.	Sports Arena Boulevard, between Kemper Street and 1,050 feet east of Kemper Street	Replace the existing the Class III bicycle facility on the south side of Sport Arena Boulevard to a Class II bicycle facility to be consistent with the Midway-Pacific Highway Community Plan.
B-12.	Rosecrans Street, between Madrid Street and Midway Drive	Replace the existing the Class III bicycle facility on the west side of Rosecrans Street to a Class II bicycle facility to be consistent with the Midway-Pacific Highway Community Plan.
—	—	Prepare a bicycle master plan for the Proposed Action alternatives that will guide design and implementation of policies/programs to enhance access and mobility around and within the site for bicyclist of all ages and abilities.
TRANSIT NETWORK		
T-1.	Midway Drive, between East Drive to Rosecrans Street	It is recommended to further evaluate the feasibility of providing transit signal priority along the following segment locations. If transit signal priority is feasible, the Proposed Action alternatives should provide transit signal priority improvements.
T-2.	Rosecrans Street, between Dewey Road and Pacific Highway	It is recommended to further evaluate the feasibility of providing transit signal priority along the following segment locations. If transit signal priority is feasible, the Proposed Action alternatives should provide transit signal priority improvements.
T-3.	Pacific Highway, between Friars Road and Washington Street	It is recommended to further evaluate the feasibility of providing transit signal priority along the following segment locations. If transit signal priority is feasible, the Proposed Action alternatives should provide transit signal priority improvements.
T-4.	Taylor Street between Presidio Drive and I-8 Eastbound Ramps	It is recommended to further evaluate the feasibility of providing transit signal priority along the following segment locations. If transit signal priority is feasible, the Proposed Action alternatives should provide transit signal priority improvements.
—	—	Prepare a Transit Mobility Plan for Proposed Action alternative 4 and Proposed Action alternative 5 as these two alternatives propose to relocate the existing Old Town Transit Center to within the site.

TRANSPORTATION IMPACT ANALYSIS
DRAFT

NAVY OLD TOWN CAMPUS REVITALIZATION

San Diego, California
September 22, 2020

1.0 INTRODUCTION

Linscott, Law & Greenspan, Engineers (LLG) has been retained to provide professional transportation engineering services associated with the Navy Revitalization Old Town Campus (OTC) Propose Action alternatives. The Proposed Action is to revitalize the OTC in order to provide mission capable facilities for NAVWAR and other tenant commands on OTC. Redevelopment could include Navy recapitalization of the site or redevelopment through a public-private partnership.

Naval Information Systems Command (NAVWAR) (formerly known as Space and Naval Warfare Systems Command or SPAWAR) vision is to rapidly deliver cyber warfighting capability from seabed to space. NAVWAR's mission incorporates advanced technologies that enable new operational concepts to provide a competitive edge in the cyber, information warfare and space domains. NAVWAR is the primary tenant on the Naval Base (NAVBASE) Point Loma OTC. NAVBASE Point Loma is a Command of the United States (U.S.) Navy, located in San Diego, California that was established on October 1, 1998 through a consolidation of multiple Navy facilities in the San Diego region. NAVWAR proposes to revitalize NAVBASE Point Loma's OTC, which would include the construction of buildings, utilities, and infrastructure to provide mission capable facilities for NAVWAR and other tenant commands on OTC. Revitalization efforts could include Navy recapitalization of the site or redevelopment through a public-private partnership. As the property owner, the Navy (represented by NAVBASE Point Loma) would enter into a lease (pursuant to 10 U.S. Code [U.S.C.] section 2667) or a public-private partnership agreement to redevelop the OTC. NAVWAR is the action proponent for the revitalization.

As part of the process to identify revitalization alternatives, the Navy entered into an agreement with the San Diego Association of Governments (SANDAG) on September 19, 2019 to consider locating a regional transit center on the OTC as part of the revitalization effort. The agreement outlined a planning process and proposed timeline to study redevelopment of the OTC to provide mission capable facilities for NAVWAR including consideration of a transit center on the OTC that could improve transportation options for the people of San Diego, including Department of Defense (DoD) employees, to access the San Diego International Airport. The agreement is designed to provide flexibility in designing and delivering a mixed-use development compatible with the military missions of NAVWAR.

The Navy is preparing an Environmental Impact Statement (EIS) in accordance with the National Environmental Policy Act (NEPA), as implemented by the Council on Environmental Quality (CEQ) Regulations and Navy regulations for implementing NEPA. If an alternative including a transit center is selected, the ultimate development of the transit center will be the responsibility of SANDAG, who may seek funding or collaboration from other stakeholders, including the U.S. Department of Transportation and State of California, to assist with the cost of public improvements. Thus, an additional planning process to comply with both NEPA and the California Environmental Quality Act (CEQA) related to development of the transit center would be required prior to approval and construction.

LLG, Engineers has prepared this Transportation Impact Analysis as part of the planning process complying with both NEPA and CEQA. This Transportation Impact Analysis analyzes the impacts from the Proposed Action alternatives based on the currently adopted guidelines which focus on automobile delay and Level of Service. A Vehicle Miles Traveled (VMT) analysis is also included pursuant to Senate Bill (SB) 743.

In addition to the vehicular mode analyses, the multi-modal network in the influence of the Proposed Action alternatives study area was also reviewed. This included pedestrian, bicycle and transit mobility. Other mobility improvement strategies such as Intelligent Transportation Systems (ITS) (i.e. Adaptive Signal Systems, Transit Signal Priority) and Transportation Demand Management (TDM) measures were also explored as a way to partially mitigate the expected impacts of the Proposed Action alternatives. *Section 27.0* of this report provides additional details on this topic.

2.0 PROPOSED ACTION DESCRIPTION

2.1 Background

The OTC site was first used by the armed forces in 1940 via subcontract to the U.S. Army Air Corps. Use of the site transitioned to the United States Air Force in 1947. Known as Air Force Plant 19, the facility was operated by General Dynamics Corporation from approximately 1940 to the mid-1970s and was primarily used for aircraft production. Since the late 1970s, aircraft assembly was replaced by subassembly activities for various missile production programs. In 1994, ownership of the property was transferred from Air Force to the Navy (with oversight given to NAVBASE Point Loma) and manufacturing activities focused on space launch vehicle assembly as conducted by varying military contractors.

NAVWAR established the OTC site as their headquarters in 1996, with a mission focus of Navy cyber security. Site activities have since grown to include development, acquisition, and life cycle management of command, control, communications, computers, intelligence, surveillance, and reconnaissance systems for Navy, Marine Corps, and selected joint service, allied nation, and other government agency programs. NAVWAR currently employs 5,192 personnel in San Diego (94 percent of these employees are civilians) and provides approximately 1.58 billion dollars of economic benefit to the San Diego region.

The existing OTC facilities are beyond their useful life and their degradation is impacting NAVWAR's cyber warfare mission, security, and workforce safety. The Navy requires secure, safe, modern state-of-the-art space to support NAVWAR's mission requirements. NAVWAR facilities requirements include:

- Laboratory space for diagnostics, testing, evaluation, and assembly of computers, communications equipment, cyber-security, and other command and control, communications, computers, intelligence, surveillance, and reconnaissance functions (laboratory spaces may be designated as secure, requiring controlled access and specialized infrastructure).
- Warehouse and storage space to store crates of materials, sensitive electronic and computer equipment, and other materials required to support the mission (warehouse and storage spaces must accommodate forklifts, loading docks, and delivery vehicles).
- Office and administrative space for conducting executive operations and comptroller, contracts, legal, program management, engineering, and administrative support functions, including conference and auditorium space.
- Parking for personnel and visitors working at OTC.

In September 2018, the Navy issued a Request for Interest to evaluate the availability and adequacy of potential business sources to revitalize OTC through a public-private development agreement. In November 2018, the Navy held an Industry Day event to solicit responses to the Request for Interest and highlighted the Navy's willingness to consider all types of concepts to achieve Navy goals for revitalizing OTC, including long-term leases, a land exchange, or sale. The Request for Interest process resulted in 12 responses, four of which contained substantive market research for potential mixed-use redevelopment scenarios on OTC. Land exchange opportunities were not identified in the submittals.

As a result of the Navy's Request for Interest, SANDAG expressed interest in OTC as a potential location for a new transit center to provide a direct mass transit connection from San Diego and adjacent cities to the San Diego International Airport. SANDAG and the Navy signed agreements on September 19, 2019 and January 23, 2020 to define collaboration between the Navy and SANDAG on site planning and analyzing the development potential of OTC. The Navy and SANDAG worked in collaboration to explore various options for accomplishing their respective goals, including alternatives with and without a transit center on OTC.

These alternatives are described in further detail in *Section 2.3* of this report.

2.2 Location

OTC comprises two sites totaling 70.5 acres: OTC Site 1 is 48.7 acres and OTC Site 2 is 21.8 acres. OTC Site 1 is bordered by Pacific Highway to the west, Interstate 5 to the north and east, a railroad right-of-way to the east, and Barnett Avenue to the south. OTC Site 2 is adjacent to OTC Site 1 to the west. OTC Site 2 is bordered by Midway Drive to the west, Rosecrans Street to the North, Pacific Highway to the east, and Barnett Avenue to the south.

OTC is located north of downtown San Diego and south of Old Town San Diego, approximately 1/2-mile north of San Diego International Airport. The neighborhood of Mission Hills is located to the east and the Midway District and Liberty Station is located to the west. The Old Town Transit Center, an intermodal transportation station providing local bus and trolley service, commuter rail service, and regional rail service, is located approximately 400 feet north of OTC Site 1.

OTC is located in an urbanized area containing numerous shopping centers, institutional facilities, multifamily residential developments, visitor-oriented uses, and older industrial areas. The area is characterized by flat topography, and a varied mixture of auto-oriented large and small commercial developments. The Pacific Highway corridor, located between Interstate 5 on the east and Marine Corps Recruit Depot and San Diego International Airport on the west, contains commercial and industrial uses, multifamily residential developments, and airport-related commercial uses.

Figure 2–1 shows the Vicinity Map. ***Figure 2–2*** shows a more detailed map of the area surrounding the Navy OTC site.

The majority (95 percent) of the property is covered with buildings and pavement. OTC Site 1 includes three former World War II-era aircraft production warehouses (Buildings 1, 2, and 3), each approximately 310,000 square feet. The warehouses have been retrofitted as administrative office, laboratory, and storage spaces. Smaller buildings (Buildings 4, 7, 8, 27, 28, and 34) are distributed around Buildings 1, 2, and 3, along with paved access roads, vehicle parking, and materials storage areas. OTC Site 2 is dominated by operational supply Building 2555 (approximately 136,000 square feet). The remainder of the site comprises surface parking and a few small outbuildings (Buildings 34 and 40).

OTC is located within the City of San Diego's Midway-Pacific Highway Community Planning Area, which has an adopted Community Plan that describes the long-term development goals for the community. The Community Plan defines 12 distinct villages and districts within the planning area. Each village or district has a defined vision, and land use designations and policies to achieve this vision.

OTC is located within the Community Plan area defined as the Dutch Flats Urban Village. The Community Plan describes the vision for Dutch Flats as an employment and residential-focused urban village, with office and other "flex" or innovation spaces to complement and support the existing OTC uses. The Dutch Flats Urban Village provides opportunities for defense-related, research and development, other similarly focused industries to establish business locations in proximity to transit, Downtown, and San Diego International Airport. Revitalization of OTC provides a unique opportunity to satisfy urgent military mission requirements and advance the Midway-Pacific Highway Community Plan vision.

2.3 Proposed Action Alternatives

The Navy prepared an alternatives development memorandum to define the development potential on the OTC for a range of alternatives. The revitalization of OTC may be accomplished through Navy recapitalization or a number of public-private development scenarios. As such, no specific site plan has been designed for the OTC. A maximum threshold was developed for five different alternatives. This approach is a conservative analysis and should not be considered an exact representation of future development. The final development of the OTC site is subject to many variables outside of the Navy's or a private partner's control, including future market conditions, changes to regulations and other factors. The alternatives were developed using the best available information and are meant to represent an envelope approach to both maximum development and a range of lower intensity development to meet the NAVWAR purpose and need. Currently OTC is Federal property and is not subject to local zoning or development guidelines. Future revitalization of OTC anticipates the property will remain in Federal ownership and the types and intensities of mixed-use development proposed would be allowable under existing law.

In addition to the no action alternative, five action alternatives were developed for analysis. These include revitalization through Navy capital improvements only, two scenarios of mixed-use public-private development, and two scenarios of mixed-use public-private development including consideration of a potential transit center.

Alternative 1 includes all existing NAVWAR functions and requirements remaining on OTC. For Alternatives 2, 3, 4, and 5, NAVWAR determined certain functions, primarily open storage/laydown and warehouse space, may be more efficiently accommodated at an off-site location or locations, yet to be determined, that are deemed acceptable by the Navy.

The alternatives are defined in the following sections. The land use summaries for the alternatives are provided at the end of this report section in ***Table 2–1***.

2.3.1 *No-Action Alternatives*

Under the baseline No Action Alternative, the Navy would continue to maintain and repair the existing facilities. NAVWAR would continue to operate at OTC and no change would occur. The No Action Alternative would not meet the purpose and need for the Proposed Action as it would not meet NAVWAR's facility requirements for secure, safe, modern, state-of-the-art facilities. In addition, the No Action alternative would not provide for efficient operations between NAVWAR functions. The No-Action Alternative will be used to analyze the consequences and potential environmental impacts of not undertaking the Proposed Action alternatives and will serve to establish a comparative baseline for analysis.

The Airport Connectivity Analysis (October 2019), prepared by WSP, Inc. for the San Diego Association of Governments (SANDAG), evaluates the development of an automated passenger mover (APM) incorporated into the proposed Intermodal Transportation Center (ITC) located near the San Diego International Airport. The Airport Authority, together with SANDAG, seeks to connect the San Diego International Airport to the region's rail transit system. Two concepts were developed that would locate the APM service at the potential transit center located on the NAVWAR site. The addition of the APM is included in the cumulative baseline of a secondary No Action Alternative condition against which Alternatives 4 and 5 are measured, since those alternatives include the transit center, as described below, which would also serve the APM. A second baseline condition termed the "No Action Alternative including an Automated Passenger Mover" was developed for measuring the impacts of Alternative 4 and 5. More information regarding the APM is provided in *Section 8.2* of this report.

2.3.2 *Alternative 1: Navy Recapitalization at OTC*

Alternative 1 would include revitalization of OTC to meet NAVWAR's facility requirements with Navy-funded capital improvements only. This alternative does not involve private development or a transit center on the OTC site. This would include consolidating NAVWAR operations into two of the existing 310,000 square feet buildings on OTC Site 1. The existing warehouse and parking functions on OTC Site 2 would not be modified under this alternative. This alternative would include a total of 3,307,008 square feet of development and was evaluated against the No Action Alternative to determine potential significant impacts.

2.3.3 *Alternative 2: Higher-density Mixed-use Revitalization*

Alternative 2 represents a higher intensity of new public-private development on the OTC Site and would redevelop the OTC site to contain a NAVWAR footprint without warehouse and open storage with a combination of mixed use residential, office, hotel, and retail space.. Public-private development would include 6,600 residential units, one million square feet of office space, two hotels, and 180,000 square feet of retail. Retail could include restaurants and other retail shopping uses. This alternative would include 1,694,268 square feet of development for NAVWAR and 11,899,700 square feet of private mixed-use development for a total of 13,593,968 square feet of development and was evaluated against the No Action Alternative to determine potential significant impacts.

2.3.4 *Alternative 3: Lower-density Mixed-use Revitalization*

Alternative 3 represents a lower intensity of new public-private development on the OTC Site and would redevelop the OTC site to contain a NAVWAR footprint without warehouse and open storage with a combination of a lower density of mixed use residential, office, hotel, and retail space.. Public-private development would include 4,400 residential units, 650,000 square feet of office space, two hotels, and 130,000 square feet of retail. Retail could include restaurants and other retail shopping uses. This alternative would include 1,694,268 square feet of development for NAVWAR and 7,905,900 square feet of private mixed-use development for a total of 9,600,168 square feet of development and was evaluated against the No Action Alternative to determine potential significant impacts.

2.3.5 *Alternative 4: Higher-density Mixed-use Revitalization including a Transit Center*

Alternative 4 represents a higher intensity of new public-private development on the OTC Site, including development of a transit center. Alternative 4 would redevelop the OTC site to contain a NAVWAR footprint without warehouse and open storage with a higher density of mixed use residential, office, hotel, and retail space and a transit center. Public-private development would include 10,000 residential units, 1,350,000 square feet of office space, two hotels, and 250,000 square feet of retail. Retail could include restaurants and other retail shopping uses. In addition, this alternative includes the construction of an onsite transit facility on OTC Site 1. . This alternative would include 1,694,268 square feet of development for NAVWAR and 17,895,000 square feet of private mixed-use development for a total of 19,589,268 square feet of development and was evaluated against the No Action Alternative including an Automated Passenger Mover to determine potential significant impacts.

2.3.6 *Alternative 5: Lower-density Mixed-use Revitalization including a Transit Center*

Alternative 5 represents a lower intensity of new public-private development on the OTC Site, including development of a transit center. Alternative 5 would redevelop the OTC site to contain a NAVWAR footprint without warehouse and open storage with a combination of a lower density of mixed use residential, office, hotel, and retail space, and a transit center. Public-private development would include 8,000 residential units, 850,000 square feet of office space, two hotels, and 200,000 square feet of retail. Retail could include restaurants and other retail shopping uses. In addition, this alternative includes the construction of an onsite transit facility on OTC Site 1. This alternative would include 1,694,268 square feet of development for NAVWAR and 14,117,750 square feet of private mixed-use development for a total of 15,812,018 square feet of development and was evaluated against the No Action Alternative including an Automated Passenger Mover to determine potential significant impacts.

2.4 SANDAG Transit Center

The San Diego Association of Governments (SANDAG) initially identified the OTC as a potential site for a Transit Center by submitting a request to the Navy. The OTC site was formally included in the October 1st, 2019 Airport Connectivity Analysis report as an additional site to consider with connectivity to/from the San Diego International Airport.

Alternatives 4 and 5 consider the development of a transit center with the OTC as a Proposed Action alternatives element.

2.5 Alternatives Summary

To cover the full range of potential development intensities at the OTC, the five Proposed Action alternatives are summarized as follows in ***Table 2–1***.

TABLE 2–1
SUMMARY OF ON-SITE DEVELOPMENT ALTERNATIVES

Development Details	Alternative 1 [b]	Alternative 2	Alternative 3	Alternative 4	Alternative 5
Navy Development	**Total Square Feet (Equivalent Unit)**	**Total Square Feet (Equivalent Unit)**	**Total Square Feet (Equivalent Unit)**	**Total Square Feet (Equivalent Unit)**	**Total Square Feet (Equivalent Unit)**
Office	1,019,364	845,326	845,326	845,326	845,326
Laboratory	174,865	165,614	165,614	165,614	165,614
Secure Conference/ Auditorium	26,156	29,156	29,156	29,156	29,156
Warehouse/Storage	481,941	24,172	24,172	24,172	24,172
Open Storage	174,267	N/A	N/A	N/A	N/A
Parking [a]	1,430,415 (4,541 stalls)	630,000 (2,000 stalls)	630,000 (2,000 stalls)	630,000 (2,000 stalls)	630,000 (2,000 stalls)
Navy Development Total	**3,307,008**	**1,694,268**	**1,694,268**	**1,694,268**	**1,694,268**
Private Development	**Total Square Feet (Equivalent Unit)**	**Total Square Feet (Equivalent Unit)**	**Total Square Feet (Equivalent Unit)**	**Total Square Feet (Equivalent Unit)**	**Total Square Feet (Equivalent Unit)**
Residential	Not applicable	6,336,000 (6,600 units)	4,224,000 (4,400 units)	9,600,000 (10,000 units)	7,680,000 (8,000 units)
Residential-Parking	Not applicable	3,326,400 (9,504 stalls)	2,217,600 (6,336 stalls)	5,040,000 (14,400 stalls)	4,032,000 (11,520 stalls)
Office	Not applicable	1,000,000	650,000	1,350,000	850,000
Office-Parking	Not applicable	525,000 (1,500 stalls)	341,250 (975 stalls)	708,750 (2,025 stalls)	446,250 (1,275 stalls)
Hotel	Not applicable	260,000 (2 hotels, 400 rooms)	160,000 (1 hotel, 250 rooms)	290,000 (2 hotels, 450 rooms)	290,000 (2 hotels, 450 rooms)
Hotel-Parking	Not applicable	140,000 (400 stalls)	87,500 (250 stalls)	157,500 (450 stalls)	157,500 (450 stalls)
Retail	Not applicable	180,000	130,000	250,000	200,000
Retail-Parking	Not applicable	132,300 (378 stalls)	95,550 (273 stalls)	183,750 (525 stalls)	147,000 (420 stalls)
Transit Center	Not applicable	Not applicable	Not applicable	140,000	140,000
Transit Center-Parking	Not applicable	Not applicable	Not applicable	175,000 (500 stalls)	175,000 (500 stalls)
Private Development Total	Not applicable	**11,899,700**	**7,905,900**	**17,895,000**	**14,117,750**
GRAND TOTAL	**3,307,008**	**13,593,968**	**9,600,168**	**19,589,268**	**15,812,018**

Source: Table 2-3, Alternatives Summary Matrix, Navy OTC Revitallization EIS, Draft DOPAA.

Footnotes:

a. In support of NAVWAR's parking requirement, 4,358 stalls would be required, either on-site or at a separate nearby location.
b. Alternative 1 represents requirements identified by NAVWAR through a basic facility requirements document.

General Notes:

1. SF = Square feet.

3.0 STUDY AREA, ANALYSIS APPROACH, AND METHODOLOGY

3.1 Study Area

The study area for the Proposed Action was developed based on guidelines contained in the *City of San Diego Traffic Impact Study Manual* and a working knowledge of the local transportation system. Below lists study area locations included in the analysis:

<u>STUDY INTERSECTIONS</u>

1. Taylor St/ Hotel Circle South
2. Taylor St/ I-8 EB Ramps
3. Taylor St/ Morena Blvd/Whitman St
4. Taylor St/ Juan St
5. Congress St/ Taylor St
6. Pacific Hwy/ Rosecrans St/Taylor St
7. Rosecrans St/ Jefferson St
8. Camino Del Rio W/ Hancock St
9. Camino Del Rio W/ Kurtz St
10. Rosecrans St/ Kurtz St
11. Rosecrans St/ Sports Arena Blvd/ Camino Del Rio W
12. Rosecrans St/ Midway Dr
13. Sunset Cliffs Boulevard/ I-8 Eastbound On-Ramp
14. Truxtun Rd/ Lytton St/Barnett Ave
15. Midway Dr/ Enterprise St
16. Barnett Ave/ Midway Dr
17. Pacific Hwy/ Telegraph Pl
18. Pacific Hwy/ Kurtz St
19. Sports Arena Blvd/ Pacific Hwy
20. Pacific Hwy/ Enterprise St
21. Pacific Hwy/ Barnett Ave
22. Old Town Ave/ San Diego Ave
23. Old Town Ave/ Moore St
24. Hancock St/Old Town Ave/ I-5 SB Off-Ramps
25. Witherby St/ Hancock St
26. Witherby St/ Pacific Hwy
27. Tripoli Ave/ Witherby St
28. Noell St/ Hancock St
29. Washington St/ San Diego Ave
30. Washington St/ Hancock St
31. Washington St/ Pacific Hwy (N)

3.2 Analysis Approach

The Proposed Action alternatives consist of a no-action alternative and five intensified land use alternatives. Given the scale of each alternative, development of any Proposed Action alternative will occur over several years into the future. In order to provide for a worst-case analysis, significant impacts were measured assuming complete construction of each alternative over baseline conditions. The Year 2050 was selected as the baseline year for estimated alternative completion. Thus, the Year 2050 No-Action Alternative provides the baseline for measure significant *cumulative* transportation impacts.

As previously mentioned, the Airport Connectivity Analysis evaluates the development of an automated passenger mover (APM) incorporated into the proposed Intermodal Transportation Center (ITC) located near the San Diego International Airport. The Airport Authority, together with SANDAG, seeks to connect the San Diego International Airport to the region’s rail transit system. Two concepts were developed that would locate the APM service at the potential transit center located on the NAVWAR site. The addition of the APM is included in a secondary Year 2050 cumulative baseline against which Alternatives 4 and 5 are measured, since those alternatives include the transit center. Thus, the Year 2050 No Action Alternative including an Automated Passenger Mover condition was developed for measuring the impacts of Alternative 4 and 5. More information regarding the APM is provided in *Section 8.2* of this report.

An interim near-term condition is also evaluated for consistency with local requirements in evaluating significant *direct* transportation impacts. The Year 2030 was selected for the near-term condition. A portion of Alternative 2: Higher-density Mixed-use Revitalization represents the most intense land use development and resulting trip generation (without the transit center) that could partially develop within a 10-year timeframe. Thus, the near-term analysis assumes 25% of Alternative 2 would develop by Year 2030.

Table 3–1 shows the analyses performed in each of the scenarios to determine the potential impacts to the roadway system.

TABLE 3–1
LEVEL OF SERVICE ANALYSIS SCENARIOS

Scenarios	Analysis Performed
• Existing (Year 2020) • Year 2050 No-Action Alternative • Year 2050 with No-Action Alternative including an Automated Passenger Mover • Year 2050 with Alternative 1: Navy Recapitalization at OTC • Year 2050 with Alternative 2: Higher-density Mixed-use Revitalization • Year 2050 with Alternative 3: Lower-density Mixed-use Revitalization • Year 2050 with Alternative 4: Higher-density Mixed-use Revitalization including a Transit Center • Year 2050 with Alternative 5: Lower-density Mixed-use Revitalization including a Transit Center • Near-Term Year 2030 • Near-Term with Year 2030 Alternative 2: Higher-density Mixed-use Revitalization (25%)	• Peak Hour Intersection Analysis • Daily Street Segment Analysis • Peak Hour Freeway Mainline Analysis • Peak Hour Freeway Ramp Meter Analysis

3.3 Methodology

Level of service (LOS) is the term used to denote the different operating conditions which occur on a given roadway segment under various traffic volume loads. It is a qualitative measure used to describe a quantitative analysis considering factors such as roadway geometries, signal phasing, speed, travel delay, freedom to maneuver, and safety. Level of service provides an index to the operational qualities of a roadway segment or an intersection. Level of service designations range from A to F, with LOS A representing the best operating conditions and LOS F representing the worst operating conditions. Level of service designation is reported differently for signalized and unsignalized intersections, as well as for roadway segments.

3.3.1 *Intersections*

Signalized intersections were analyzed under weekday 7:00-9:00 a.m. and 4:00-6:00 p.m. peak hour conditions. Average vehicle delay was determined utilizing the methodology found in Chapter 18 of the *2016 Highway Capacity Manual (HCM 6th Edition)*, with the assistance of the *Synchro* (version 10) computer software. The delay values (represented in seconds) were qualified with a corresponding intersection LOS. A more detailed explanation of the methodology is attached in ***Appendix A***. ***Table 3–2*** shows the signalized intersection delay categorized for each level of service (LOS).

City of San Diego and Caltrans location-specific signal timing plan information such as minimum greens, cycle lengths, splits for the freeway interchanges and real-time peak hour field observations were included in the analysis, where available. In addition, where applicable, the presence of railroad/trolley crossings near intersections where accounted for in the analysis.

Unsignalized intersections were analyzed under weekday 7:00-9:00 a.m. and 4:00-6:00 p.m. peak hour conditions. Average vehicle delay and Levels of Service (LOS) were determined based upon the procedures found in Chapters 19 and 20 of the *HCM 6*, with the assistance of the *Synchro* (version 10) computer software. A more detailed explanation of the methodology is attached in *Appendix A*. *Table 3–2* shows the unsignalized intersection delay categorized for each level of service (LOS).

TABLE 3–2
INTERSECTION LOS & DELAY RANGES

LOS	Delay (seconds/vehicle)	
	Signalized Intersections	**Unsignalized Intersections**
A	≤ 10.0	≤ 10.0
B	10.1 to 20.0	10.1 to 15.0
C	20.1 to 35.0	15.1 to 25.0
D	35.1 to 55.0	25.1 to 35.0
E	55.1 to 80.0	35.1 to 50.0
F	≥ 80.1	≥ 50.1

Source: Highway Capacity Manual

The HCM 6th edition analysis methodology requires strict adherence to standard dual ring National Electrical Manufacturers Association (NEMA) phasing. Conflicting phase overlaps, clustered intersections or other non-compliant phasing sequences cannot be analyzed using this method.

3.3.2 *Street Segments*

Street segment analysis is based upon the comparison of daily traffic volumes (ADTs) to the City of San Diego’s *Roadway Classification, Level of Service, and ADT Table*. This table provides segment capacities for different street classifications, based on traffic volumes and roadway characteristics. ***Table 3–3*** shows the City of San Diego’s Roadway Classification.

TABLE 3–3
LEVEL OF SERVICE (LOS) THRESHOLDS FOR ROADWAY SEGMENTS

Classification	Lanes	Level of Service (LOS)				
		A	**B**	**C**	**D**	**E**
Freeway	8	60,000	84,000	120,000	140,000	150,000
Freeway	6	45,000	63,000	90,000	110,000	120,000
Freeway	4	30,000	42,000	60,000	70,000	80,000
Expressway	6	30,000	42,000	60,000	70,000	80,000
Prime Arterial	6	25,000	35,000	50,000	55,000	60,000
Major Arterial	6	20,000	28,000	40,000	45,000	50,000
Major Arterial	4	15,000	21,000	30,000	35,000	40,000
Collector	4	10,000	14,000	20,000	25,000	30,000
Collector (no center lane or continuous left-turn lane)	4 2	5,000	7,000	10,000	13,000	15,000
Collector (no fronting property)	2	4,000	5,500	7,500	9,000	10,000
Collector (commercial-industry fronting)	2	2,500	3,500	5,000	6,500	8,000
Collector (multi-family)	2	2,500	3,500	5,000	6,500	8,000
Collector (single-family)	2	—	—	2,200	—	—

Notes:
1. The volumes and the average daily level of service listed above are only intended as a general planning guideline.
2. Levels of service are not applied to residential streets since their primary purpose is to serve abutting lots, not carry through traffic. Levels of service normally apply to roads carrying through traffic between major trip generators and attractors.

Source: City of San Diego Traffic Impact Study Manual

3.3.3 *Freeway Segments*

Freeway segments were analyzed under a.m. and p.m. peak hour based on the standards outlined in the *Caltrans Guide for the Preparation of Traffic Impact Studies using Highway Capacity Manual* (HCM 6th Edition). The freeway analyses were conducted using the *Highway Capacity Software* (HCS version 7.3). The freeway analysis is based on assessing freeway operations based on traffic volumes, freeway lane configurations and other segment specific characteristics and reporting freeway volume to capacity ratio, speed and density. ***Table 3–4*** presents the freeway segment criteria based on density.

TABLE 3–4
FREEWAY SEGMENT LOS CRITERIA

LOS	Density Range (pc/mi/ln)
A	0 – 11
B	> 11 – 18
C	> 18 – 26
D	> 26 – 35
E	> 35 – 45
F	> 45

General Notes:

1. *Source: HCM 6th Edition*
2. pc/mi/ln– Passenger car per mile per lane

The freeway analyses significance criteria uses “Volume to Capacity ratio (v/c)” or “Speed” as the measures of effectiveness (MOE) to determine impacts on freeways. While Freeway Density has been reported in the analyses, v/c was used as the MOE to determine significant project impacts on freeways given the software limitations in reporting speeds at congested conditions (i.e. LOS F).

3.3.4 *Metered Freeway On-Ramps*

Ramp metering is a means of controlling the volume of traffic entering the freeway with the goal of improving the safety, traffic operations, and flow on the freeway main lanes. Freeway ramp meter analysis estimates the peak hour queues and delays at freeway ramps by comparing existing and projected volumes to the meter rate at the given location.

Ramp meter delays and queues are reported using *the “Fixed Rate” method*. The fixed rate approach is based on the specific time intervals at which the ramp meter is programmed to release traffic based on Caltrans’ most restrictive meter rates. The ramp meter rates fluctuate during the peak hour; however, to be conservative, the most restrictive rate was used. The fixed rate approach may produce unrealistic queue lengths and delays since this approach does not take into account driver behavior such as “ramp shopping” or trip diversion. As a result, field observations were conducted to observe maximum delays and queues at the ramp meters.

Based on the above discussions, the following metered on-ramps to I-5 are analyzed.

1. Moore Street / NB I-5 On-Ramp (metered in the a.m. and p.m. peak hours)

The metering information was obtained from Caltrans for the above ramp and is included in ***Appendix B.***

3.3.5 *Pedestrian Mobility*

A local pedestrian mobility assessment was conducted by evaluating the existing pedestrian facilities and primary deficiencies within a ½ mile walking distance from the Proposed Action alternatives and the effects of the Proposed Action alternatives on the pedestrian network.

3.3.6 *Bicycle Mobility*

A local bicycle mobility assessment was conducted by evaluating the existing bicycle facilities, and primary deficiencies within a ½ mile bicycling distance from the Proposed Action alternatives were documented, and the effects of the Proposed Action alternatives on the bicycle network were evaluated.

3.3.7 *Transit Mobility*

An extensive transit mobility assessment was conducted by evaluating the existing transit facilities and amenities within a ½ mile walking distance from the Proposed Action alternatives and the effects of the Proposed Action alternatives on the transit network.

3.3.8 *Vehicle Miles Traveled*

In compliance with Senate Bill 743 (SB 743), this Transportation Impact Study also evaluates compliance with SB 743, this Transportation Impact Study also evaluates the potential vehicular impacts using a Vehicle Miles Traveled (VMT) metric. Public Resources Code section 20199, enacted under SB 743, identifies VMT as an appropriate metric for measuring transportation impacts. VMT analysis focuses on the number and length of vehicle trips made by the Proposed Action's employees and residents.

4.0 EXISTING VEHICULAR MOBILITY

This section presents the existing roadway conditions within the OTC area. ***Figure 4–1*** shows existing conditions diagrams for study area locations.

4.1 Existing Roadway Network

The following is a description of the existing roadway network in the study area.

Interstate 5 (I-5) is a major north-south Interstate Freeway providing interregional connectivity between San Diego County and Orange and Los Angeles Counties to the north. It has a posted speed limit of 65 miles per hour. Within the study area, I-5 generally consists of eight travel lanes in the north-south direction with additional auxiliary lanes.

Interstate 8 (I-8) is a major east-west Interstate Freeway providing interregional connectivity between San Diego County and Imperial County to the east. It has a posted speed limit of 65 miles per hour. Within the study area, I-8 generally consists of eight travel lanes in the east-west direction with additional auxiliary lanes.

Rosecrans Street is a four to six-lane roadway oriented in a north-south direction within the study area, which is from Lytton Street to Pacific Highway. North of Pacific Highway, Rosecrans Street changes names and becomes Taylor Street.

> **From Lytton Street to Sports Arena Boulevard**, Rosecrans Street is classified as a six-lane Major Arterial per the *Midway-Pacific Highway Community Plan*. Class II bike lanes are provided on both sides of Rosecrans Street between Malaga Street and Sports Arena Boulevard. On-Street parking is prohibited on both sides of the roadway and the posted speed limit is 35 mph.
>
> **From Sports Arena Boulevard to Pacific Highway**, Rosecrans Street is classified as a four-lane Collector with a center two-way left-turn lane per the *Midway-Pacific Highway Community Plan*. Class II bike lanes are not provided along this segment of Rosecrans Street. On street parking is prohibited on both sides of the roadway and the posted speed limit is 35 mph.

Taylor Street transitions from a two-lane to a five-lane roadway oriented in a north-south direction within the study area, which is from Pacific Highway to Hotel Circle South. South of Pacific Highway, Taylor Street changes names and becomes Rosecrans Street.

> **From Pacific Highway to Juan Street**, Taylor Street is classified as a four to five-lane Major Arterial per the *Old Town Community Plan*. Class II bike lanes are not provided on either side of the road. On-Street parking is prohibited on both sides of the roadway and the posted speed limit is 35 mph.

From Juan Street to Morena Boulevard, Taylor Street is classified as a four-lane Major Arterial per the *Old Town Community Plan*. Class II bike lanes are not provided on either side of the road. On-Street parking is prohibited on both sides of the roadway and the posted speed limit is 35 mph.

From Morena Boulevard to Hotel Circle South, Taylor Street is classified as a two-lane Collector per the *Old Town Community Plan*. Class II bike lanes are provided on both sides of Taylor Street. On-Street parking is prohibited on both sides of the roadway and the posted speed limit is 35 mph.

Hotel Circle South is classified as a two-lane Collector (one-way) in the *Mission Valley Community Plan*. Hotel Circle South is currently constructed as a two-lane undivided roadway (two-way). On-street parking is intermittently permitted on the south side of the road. Class II bike lanes are not provided on either side of the road. The posted speed limit is 35 mph.

Pacific Highway is primarily a six-lane roadway oriented in a north-south direction within the study area, which is from Taylor Street to Laurel Street. Pacific Highway runs parallel to Interstate 5 and provides direct access to the OTC site.

From Taylor Street to Sports Arena Boulevard, Pacific Highway is classified as a six-lane Major Arterial with a raised median per the *Midway-Pacific Highway Community Plan*. Class II bike lanes are provided on both sides of Pacific Highway. On-Street parking is prohibited on both sides of the roadway and the posted speed limit is 45 miles per hour (mph).

From Sports Arena Boulevard to Barnett Avenue, Pacific Highway is classified as a five-lane Prime Arterial with a raised median per the *Midway-Pacific Highway Community Plan*. Class II bike lanes are not provided along this segment of Pacific Highway except for a 200-foot section in the northbound direction near the signalized intersection at Enterprise Street. On street parking is prohibited on both sides of the roadway and the posted speed limit is 45 miles per hour.

From Barnett Avenue to Washington Street, Pacific Highway is classified as a six-lane Expressway per the *Midway-Pacific Highway Community Plan*. The existing condition along this portion of Pacific Highway includes a flyover ramp for vehicles in the northbound direction traveling to Barnett Avenue. Currently, on and off ramps to the Witherby Street undercrossing are provided, which lead to Interstate 5 via Hancock Street. Class II bike lanes are not provided on either side of the road along this section of Pacific Highway. On-Street parking is prohibited on both sides of the roadway and the posted speed limit is 55 miles per hour.

From Washington Street to Sassafras Street, Pacific Highway is classified as a six-lane Prime Arterial per the *Midway-Pacific Highway Community Plan*. The existing condition along this portion of Pacific Highway includes a flyover on-ramp for southbound vehicles traveling to southbound I-5 and a flyover off-ramp for northbound I-5 vehicles traveling to northbound Pacific Highway. Class II bike lanes are not provided on either side of the road along this section of Pacific Highway. On-Street parking is prohibited on both sides of the roadway and the posted speed limit is 45 miles per hour.

From Sassafras Street to Laurel Street, Pacific Highway is classified as a six-lane Major Arterial per the *Midway-Pacific Highway Community Plan*. Class II bike lanes are not provided on either side of the road along this section of Pacific Highway. On-Street parking is prohibited on both sides of the roadway and the posted speed limit is 45 miles per hour.

Morena Boulevard is classified as a three-lane Major Arterial per the *Old Town Community Plan*. Within the study area, which is between the I-8 Ramps and Taylor Street, Morena Boulevard is generally constructed as a four-lane divided roadway. Class II bike lanes are not provided on either side of the road. On-Street parking is prohibited on both sides of the roadway. No posted speed limit was observed.

Kurtz Street is classified as a two-lane Collector per the *Midway-Pacific Highway Community Plan*. Class II bike lanes are not provided on either side of the road. On-Street parallel parking is permitted on both sides of the roadway. The posted speed limit is 30 mph.

Sports Arena Boulevard transitions from a two-lane to a five-lane roadway oriented in a north-south direction within the study area, which is from Kemper Street to Enterprise Street. Sports Arena Boulevard provides vehicular and pedestrian access to the OTC site's existing North and West parking lots.

From Kemper Street to Rosecrans Street, Sports Arena Boulevard is classified as a five-lane Major Arterial with a raised median per the *Midway-Pacific Highway Community Plan*. Class II bike lanes are not provided on either side of the road along this section of Sports Arena Boulevard. On-Street parking is prohibited on both sides of the roadway and the posted speed limit is 35 miles per hour (mph).

From Rosecrans Street to Enterprise Street, Sports Arena Boulevard is classified as a two-lane Collector per the *Midway-Pacific Highway Community Plan*. Class II bike lanes are not provided on either side of the road along this section of Sports Arena Boulevard. On-Street parallel parking is permitted on both sides of the roadway and the posted speed limit is 35 miles per hour (mph).

Enterprise Street functions as a two-lane Collector with a center two-way left-turn lane from Pacific Highway to Midway Drive. The *Midway-Pacific Highway Community Plan* does not classify this roadway. Enterprise Street provides vehicular and pedestrian access to the OTC site's existing West parking lot. Sidewalks are provided along both sides of the road. Angled parking is provided on both sides of the road and there is no posted speed limit on this roadway.

Midway Drive is classified as a four-lane Collector with a center two-way left-turn lane per the *Midway-Pacific Highway Community Plan*. On-street parking is intermittently permitted on the south side of the road. Class II bike lanes are not provided on either side of the road. The posted speed limit is 35 mph.

Lytton Street is classified as a four-lane Collector with a center two-way left-turn lane per the *Midway-Pacific Highway Community Plan*. Class II bike lanes are not provided on either side of the road. On-Street parking is prohibited on both sides of the roadway. The posted speed limit is 40 mph. East of Truxtun Road, Lytton Street changes names and becomes Barnett Avenue.

Barnett Avenue is classified as a four-lane Collector with a center two-way left-turn lane per the *Midway-Pacific Highway Community Plan*. A raised median and Class II bile lanes are provided along Barnett Avenue between Truxtun Road and Henderson Avenue. On-Street parking is prohibited on both sides of the roadway. The posted speed limit is 40 mph. West of Truxtun Road, Barnett Avenue changes names and becomes Lytton Street.

Hancock Street is classified as a two-lane Collector per the *Midway-Pacific Highway Community Plan*. Class II bike lanes are not provided on either side of the road. On-Street parking is permitted on both sides of the roadway; parallel parking on the north side and diagonal parking on the south side. West of Noell Street, Hancock transitions from a two-lane, two-way street to a one-way (eastbound), two-way street. The posted speed limit is 30 mph.

Washington Street is classified as four-lane Major Arterial between Frontage Road and Hancock Street per the *Midway-Pacific Highway Community Plan*. North of India Street, Washington Street is classified as 4-lane Prime Arterial per the *Uptown Community Plan.* Class II bike lanes are provided on portions of Washington Street north of India Street. On-Street parking is generally not permitted with the exception of along a small segment between San Diego Avenue and just north of India Street. South of India Street he posted speed limit is 25 mph. No posted speed limit signs were observed north of India Street.

4.2 Existing Traffic Volumes

This section presents a summary of the existing traffic volumes obtained for the various facilities in the Proposed Action study area. ***Figure 4–2*** shows the existing traffic volumes at study area locations.

Existing weekday daily traffic counts and a.m. (7:00–9:00 a.m.) and p.m. (4:00–6:00 p.m.) peak hour traffic volume counts were collected at the study area intersections and street segments in January 2020. ***Appendix C*** contains the manual intersection and street segment count sheets and the signal timing plans.

Existing Freeway traffic volumes were obtained from the most recent *Caltrans 2017 Volumes on California State Highways*. Counts at the analyzed ramp meters were obtained from the *Freeway Performance Measurement System* (PeMS) during the month of September 2019. Ramp metering information was obtained from Caltrans and is included in *Appendix B*.

5.0 SIGNIFICANCE CRITERIA

For the purposes of this transportation impact study, City of San Diego significant criteria for level of service (LOS) operations was utilized. According to the City of San Diego's *Significance Determination Thresholds* dated July 2016, a project is considered to have a significant impact if project traffic would decrease the operations of surrounding roadways by a defined threshold. The City defined thresholds are shown in ***Table 5–1***.

The impact is designated either a "direct" or "cumulative" impact. According to the City's *Significance Determination Thresholds*,

> "*Direct* traffic impacts are those projected to occur at the time a proposed development becomes operational, including other developments not presently operational but which are anticipated to be operational at that time (near term)."
>
> "*Cumulative* traffic impacts are those projected to occur at some point after a proposed development becomes operational, such as during subsequent phases of a project and when additional proposed developments in the area become operational (short-term cumulative) or when affected community plan area reaches full planned buildout (long-term cumulative)."
>
> It is possible that a project's near term (direct) impacts may be reduced in the long term, as future projects develop and provide additional roadway improvements (for instance, through implementation of traffic phasing plans). In such a case, the project may have direct impacts but not contribute considerably to a cumulative impact."
>
> For intersections and roadway segments affected by a project, level of service (LOS) D or better is considered acceptable under both direct and cumulative conditions."

For the cumulative impact analysis presented in this report, the Year 2050 analysis represents the cumulative condition when the Proposed Action alternatives would be fully operational over the buildout ambient traffic conditions. Direct impacts from the Proposed Action alternatives were evaluated assuming the most intensive development that would be expected to occur within a 10-year timeframe, by Year 2030. Approximately 25 percent of Alternative 2 was used in the Year 2030 analysis.

If a Proposed Action alternatives' impacts exceed the thresholds in *Table 5–1*, then the Proposed Action alternative is considered to have a significant "direct" or "cumulative" transportation impact. A significant direct or cumulative impact can also occur if the Proposed Action alternatives cause the Level of Service to degrade from D to E, even if the allowable increases in *Table 5–1* are not exceeded. A feasible mitigation measure will need to be identified to return the impact within the City thresholds, or the impact will be considered significant and unavoidable.

Table 5–1
City Of San Diego
Traffic Impact Significant Thresholds

Level of Service with Project[b]	Allowable Increase Due to Project Impacts[a]				
	Freeways		Roadway Segments	Intersections	Ramp Metering[c]
	V/C	Speed (mph)	V/C	Delay (sec.)	Delay (min.)
E	0.010	1.0	0.02	2.0	2.0
F	0.005	0.5	0.01	1.0	1.0

Footnotes:

a. If a proposed project's traffic causes the values shown in the table to be exceeded, the impacts are determined to be significant. The project applicant shall then identify feasible improvements (within the Traffic Impact Study) that will restore/and maintain the traffic facility at an acceptable LOS. If the LOS with a proposed project becomes unacceptable (see note b), or if a project adds a significant amount of peak-hour trips to cause any traffic queues to exceed on- or off-ramp storage capacities, the project applicant shall be responsible for mitigating the project's direct significant and/or cumulatively considerable traffic impacts.

b. All LOS measurements are based upon Highway Capacity Manual procedures for peak-hour conditions. However, V/C ratios for roadway segments are estimated on an ADT/24-hour traffic volume basis (using Table 2 of the City's Traffic Impact Study Manual). The acceptable LOS for freeways, roadways, and intersections is generally "D" ("C" for undeveloped locations). For metered freeway on ramps, LOS does not apply. However, ramp meter delays above 15 minutes are considered excessive.

c. The allowable increase in delay at a ramp meter with more than 15 minutes delay and upstream freeway LOS E is 2 minutes. The allowable increase in delay at a ramp meter with more than 15 minutes delay and upstream freeway LOS F is 1 minute.

General Notes:

1. Delay = Average control delay per vehicle measured in seconds for intersections or minutes for ramp meters
2. LOS = Level of Service
3. V/C = Volume to Capacity ratio
4. Speed = Arterial speed measured in miles per hour

6.0 EXISTING ANALYSIS

The analysis of existing conditions includes the assessment of the study area intersections, street segments, metered freeway on-ramps and freeway mainline segments using the methodologies described in *Section 3.3* of this report.

6.1 Peak Hour Intersection Operations

Intersection capacity analyses were conducted for the study intersections under Existing conditions. ***Table 6–1*** reports the intersection operations during peak hour conditions. The following intersections are calculated to currently operate at LOS E or F:

- Intersection #6. Pacific Highway/ Rosecrans Street/ Taylor Street – LOS E during the p.m. peak hour
- Intersection #14. Truxtun Road/ Lytton Street/ Barnett Avenue – LOS E during the p.m. peak hour
- Intersection #18. Pacific Highway/ Kurtz Street – LOS E during the p.m. peak hour
- Intersection #20. Pacific Highway/ Enterprise Street – LOS E during the a.m. and p.m. peak hour

Appendix D contains the intersection analysis worksheets for the Existing scenario.

6.2 Daily Street Segment Operations

Street segment analyses were conducted for roadways in the study area under Existing conditions. ***Table 4–2*** reports the Existing daily street segment operations. The following study area roadway segments are calculated to currently operate at LOS E or F:

- Street Segment #1: Rosecrans Street: Dewey Road to Lytton Street (LOS F)
- Street Segment #2: Rosecrans Street: Lytton Street to Midway Drive (LOS F)
- Street Segment #3: Rosecrans Street: Midway Drive to Sports Arena Boulevard (LOS F)
- Street Segment #9: Taylor Street: Presidio Drive to I-8 East Ramp (LOS F)
- Street Segment #19: Morena Boulevard: Friars Road to I-8 (LOS F)
- Street Segment #20. Linda Vista Road: Morena Boulevard to Colusa Street (LOS E)
- Street Segment #21: Kurtz Street: Rosecrans to Pacific Highway (LOS F)
- Street Segment #26: Midway Drive: East Drive to Rosecrans Street (LOS F)
- Street Segment #29: Lytton Street: Rosecrans Street to St. Charles Street (LOS E)
- Street Segment #30: Barnett Avenue: St. Charles Street to Henderson Avenue (LOS E)
- Street Segment #31: Barnett Avenue: Henderson Avenue to Pacific Highway (LOS F)
- Street Segment #32: Hancock Street: Old Town Avenue to Witherby Street (LOS F)
- Street Segment #34: Hancock Street: Noell Street to W. Washington Street (LOS F)
- Street Segment #35: W. Washington Street: Admiral Boland Way to Pacific Highway (LOS F)

6.3 Peak Hour Freeway Segment Operations

Freeway segments were analyzed under Existing conditions. ***Table 4–3*** report the Existing freeway segment operations. The following freeway segments are calculated to currently operate at LOS E or F:

- Freeway Segment #12. I-8: I-5 to Morena Boulevard, WB (LOS E during the a.m. peak hour)
- Freeway Segment #13. I-8: Morena Boulevard to Hotel Circle/Taylor St, WB (LOS E during the a.m. peak hour)
- Freeway Segment #14. I-8: Taylor Street to Hotel Circle, EB (LOS E during the p.m. peak hour)
- Freeway Segment #15. I-8: Hotel Circle to SR-163, EB (LOS F during the p.m. peak hour)

Appendix F contains detailed calculation sheets for the Existing conditions.

6.4 Peak Hour Ramp Meter Operations

Metered On-Ramp analysis was conducted under Existing conditions. ***Table 4–4*** reports the Existing per lane ramp meter operations including the delays and queues and ***Table 4–5*** summarizes the observed maximum queue and delay at each ramp. The calculations shown in the table are per lane. The total on-ramp volume is divided by the number of lanes on the On-Ramp. The calculations assume the *most restrictive* discharge rates obtained from the Caltrans, during the a.m. peak hour of 7:30 a.m. to 8:30 a.m. and p.m. peak hour of 4:30 p.m. to 5:30 p.m. The following summarizes the existing metered ramp operations:

- Ramp Meter #1. Moore Street/ NB I-5 On-Ramp – No delays or queues were calculated at the *Moore Street / NB I-5 On-Ramp* during the a.m. peak hour, and a queue of 64 vehicles and a delay of 12 minutes was calculated during the p.m. peak hour.

  <u>Field observations</u> at this on-ramp indicate maximum queues of three vehicles corresponding to a delay of 0.2 minutes during the a.m. peak hour and maximum queues of two vehicles corresponding to a delay of 0.4 minutes during the p.m. peak hour.

As shown in *Section 6.3* above, the freeway mainline segment downstream of this metered on-ramp is calculated to operate at an acceptable LOS D or better. Therefore, this on-ramp is expected to operate at an acceptable delay under Existing conditions.

1. Moore Street / NB I-5 On-Ramp							
Existing - Calculated							2 SOV
	AM	242	335	0	0	0	0
	PM	382	318	64	12	1,588	64

Footnotes:

a. Peak Hour Flow "D" is the traffic that desires to enter the freeway at this on-ramp during the peak hour.
b. Discharge Rate "R" is the *most restrictive* rate at which the ramp meter (signal) discharges traffic on to the freeway (See *Appendix B* for the ramp meter data obtained from Caltrans).
c. Excess Demand "E" is the difference between the Peak Hour Flow and the Discharge Rate.
d. Delay in minutes per lane experienced by each vehicle, calculated as the ratio of the Excess Demand and the Peak Hour Flow in one minute.
e. Queue per lane is reported in feet and is calculated as 25 feet per vehicle.

General Note:

1. SOV – Single Occupancy Vehicle Lane

TABLE 6–5
FIELD OBSERVED METERED ON-RAMP MAXIMUM QUEUE AND DELAY

Ramp	Peak Hour	Lane 1		Lane 2	
		Queue (Vehicles)	Delay (Minutes)	Queue (Vehicles)	Delay (Minutes)

	PM	2	0.3	2	0.4

General Note:

1. Higher of the delay / queue is reported in the text.

7.0 TRIP GENERATION/DISTRIBUTION/ASSIGNMENT

The following five Proposed Action alternatives were considered for the purposes of trip generation, distribution and assignment:

- Alternative 1: Navy Recapitalization at OTC
- Alternative 2: Higher-density Mixed-use Revitalization
- Alternative 3: Lower-density Mixed-use Revitalization
- Alternative 4: Higher-density Mixed-use Revitalization including a Transit Center
- Alternative 5: Lower-density Mixed-use Revitalization including a Transit Center
- Alternative 2: Higher-density Mixed-use Revitalization assumed 25% development for Year 2030

Each Proposed Action alternative consists of a mix of various land uses. ***Table 7–1*** is a breakdown of the land uses and densities for each alternative that were then used in the trip generation calculations.

TABLE 7–1
PROPOSED ACTION ALTERNATIVE LAND USES AND DENSITIES

Land Use	Unit	Alternative 1	Alternative 2	Alternative 3	Alternative 4	Alternative 5
Navy Recapitalization	KSF	1,876	1,064	1,064	1,064	4,064
Multi-family Residential	DU	NA	6,600	4,400	10,000	8,000
Community Retail	KSF	NA	180	130	250	200
Commercial Office	KSF	NA	1,000	650	1,350	850
Hotel	Rooms	NA	400	250	450	450
Transit Center		No	No	No	Yes	Yes

General Notes:

1. KSF=1,000 Square Feet. DU=Dwelling Unit. NA=Not Applicable
2. Additional land use square footage details included earlier in this report in Table 2–1.
3. For the Year 2030 analysis, 25% of Alternative 2 was assumed.

7.1 Trip Generation

7.1.1 *Trip Rates*

The trip generation rates for the Proposed Action alternatives were based on the City of San Diego *Trip Generation Manual (May 2003).* The City has separate trip rates for "cumulative" trips and "driveway" trips. The City defines cumulative trips as new trips to the street system (akin to "primary" trips in the nationally published Institute of Transportation Engineers (ITE) *Trip*

Generation Manual, 10th edition. Driveway trips are the combination of cumulative trips and pass-by/diverted trips. Further explanation of these trip types is provided below.

Cumulative (Primary) Trips

Development of new land uses will create trips on a street system that are new, or "cumulative" trips. However, several types of retail/commercial developments experience local and regional trips at the driveways that are already on the street system whether that development exists or not. These trips are known as "pass-by" or "diverted link" trips.

Pass-by trips are trips that are already on the street system passing along the site frontage (Pacific Highway, Sports Arena Boulevard, and Midway Drive), and only appear as new trips in and out of the site driveways.

Diverted Link trips are trips that have deviated from a roadway within the vicinity of the development to access the site. The roadway from which the trip is diverted could include streets or freeways that are adjacent to the development, but without direct access to the development (Pacific Highway, Sports Arena Boulevard, Midway Drive, Old Town Avenue, I-5, and Witherby Street).

Driveway Trips

Driveway trips are all trips that occur at the driveways to a development. They are the combination of the three trip types described above: cumulative, pass-by and diverted link trips. It should be noted that given the site plan for the OTC Site is currently conceptual, the actual location of driveways is currently unknown. Regardless, driveway trips were assigned to within close proximity to the OTC Site frontage.

Each land use for the Proposed Action alternatives was compared to the City's trip rates and the appropriate rates were assigned.

7.1.2 *Trip Reductions*

With the development of the Proposed Actions alternatives 2 through 5, redevelopment of the site would occur that reduces the existing footprint and square footages of the Navy operations. In addition, the mix-use nature of the land uses and the OTC Site being located within a TPA qualifies the Proposed Action alternatives for additional trip credits. These redcutions are described in further detail below.

For Proposed Action alternatives 2 through 5, three driveway trip reductions were applied.

1) Navy Square Footage Decrease Reduction: This reduction accounts for the Navy square footage decreasing from 1,683,384 SF to 1,064,268 SF.

2) Transit, Bicycle, and Pedestrian Reduction: This reduction accounts for non-motorized trips occurring to and from the site. While the current 1998 *Traffic Impact Study Manual (TISM)* contains trip reductions for developments near transit stations, the draft 2020 *Transportation*

Study Manual (TSM) contains trip reductions for developments to account for transit, bicycle, and pedestrians in transit priority areas (TPA). Proposed Action alternatives 2 and 3 are located in close proximity to the Old Town Transit Station and Proposed Action alternatives 4 and 5 would have a transit station within the OTC Site. ***Table 7–2*** tabulates the reductions from the draft 2020 *TSM*, which were adjusted and applied as further described below.

TABLE 7–2
REDUCTIONS TO ACCOUNT FOR TRANSIT, BICYCLE AND PEDESTRIAN USE IN TPAS

Land Use Type	Daily	AM	PM
Residential	10%	14%	14%
Employment	4%	15%	15%
Retail	Not Applicable	Not Applicable	Not Applicable

Source: Table 1 of the City of San Diego's draft *Transportation Study Manual (2020)*

As part of the trip generation calculations, the residential percentage reductions were applied to the daily/AM/PM trips for the multi-family residential land use of Proposed Action alternatives and the employment percentage reductions were applied to the daily/AM/PM trips for the commercial office land use of the Proposed Action alternatives. The following additional calculation assumptions were utilized:

a) Only ¼ of the reductions were utilized for Proposed Action alternatives 2 and 3 on the basis that approximately ¼ of the Proposed Action alternative would be within ½ mile walking distance of the existing Old Town Transit Station. It should be noted that a majority of Proposed Action alternatives 2 and 3 are located within a TPA per the City of San Diego Transit Priority Area Map, however the ¼ factor was applied to be conservative. The full reductions were utilized for Proposed Action alternatives 4 and 5 on the basis that a transit station would be located within the site.

b) The hotel land use is not included in *Table 8–2* but a portion of those trips will utilize transit, walk or bike options. Since there are no reductions specified for this land use, the employment reduction of 4% per *Table 8–2* was applied to the daily hotel trips. To be conservative, 5% was utilized for the AM and PM hotel trips, ⅓ of the "Employment" category percentage. This 5% is recommended in the SANDAG's *Brief Guide of Vehicular Traffic Generation Rates for the San Diego Region*.

3) Mixed-Use Reductions: This reduction accounts for the internal trips that would occur due to the mix of land uses within the same site. The percentages found in the 1998 *TISM* were utilized. ***Table 7–3*** tabulates these reductions. It should be noted that the draft 2020 *TSM* describes a methodology by the National Cooperative Highway Research Program which was not utilized because it would require several assumptions to be made, such as vehicle occupancy, percent of transit entering/exiting, the percent of non-motorized trips entering/exiting, and requires as a detailed site plan (which is not available) to measure the distances between the land uses.

TABLE 7–3
REDUCTIONS FOR MIXED-USE DEVELOPMENTS

Land Use Type	Daily	AM	PM
Residential	10%	8%	10%
Industrial	4%	5%	5%
Commercial Office	3%	5%	45
Commercial Retail	*	*	*

Source: Table 4 of the City of San Diego's *Traffic Impact Study Manual* (1998).
*The commercial retail reduction equals the sum of the total mixed-use reduction in residential, industrial and commercial office.

As part of the trip generation calculations, the residential percentage reductions were applied to the daily/AM/PM trips for the multi-family residential land use of the Proposed Action alternatives and the commercial office percentage reductions were applied to the daily/AM/PM trips for the commercial office land use of the Proposed Action alternatives.

Although the 1998 *TISM* indicates to utilize the sum of the reduced trips for the residential and commercial office land uses to calculate commercial retail land use reduction, only a 50% factor was utilized to be conservative.

7.1.3 *Trip Generation Summary*

Table 7–4 shows a summary of the total trip generation for Alternative 1: Navy Recapitalization at OTC. As seen in *Table 7–4*, this alternative is calculated to generate approximately 800 ADT with 65 inbound / 7 outbound trips during the a.m. peak hour and 8 inbound / 72 outbound trips during the p.m. peak hour.

Table 7–5 shows a summary of the total trip generation for Alternative 2: Higher-density Mixed-use Revitalization. As seen in *Table 7–5*, the approximate amount of cumulative trips generated by this Proposed Action alternative is 51,946 ADT with 1,583 inbound / 2,472 outbound trips during the a.m. peak hour and 2,909 inbound / 2,150 outbound trips during the p.m. peak hour. The approximate amount of driveway trips generated by this Proposed Action alternative is 55,726 ADT with 1,651 inbound / 2,517 outbound trips during the a.m. peak hour and 3,098 inbound / 2,339 outbound trips during the p.m. peak hour.

Table 7–6 shows a summary of the total trip generation for Alternative 3: Lower-density Mixed-use Revitalization. As seen in *Table 7–6*, the approximate amount of cumulative trips generated by this Proposed Action alternative is 34,592 ADT with 1,044 inbound / 1,648 outbound trips during the a.m. peak hour and 1,959 inbound/ 1,429 outbound trips during the p.m. peak hour. The approximate amount of driveway trips generated by this Proposed Action alternative is 37,322 ADT with 1,093 inbound / 1,681 outbound trips during the a.m. peak hour and 2,095 inbound / 1,566 outbound trips during the p.m. peak hour.

Table 7–7 shows a summary of the total trip generation for Alternative 4: Higher-density Mixed-use Revitalization including a Transit Center. As seen in *Table 7–7*, the approximate amount of cumulative trips generated by this Proposed Action alternative is 70,022 ADT with 1,904 inbound / 3,253 outbound trips during the a.m. peak hour and 3,786 inbound / 2,690 outbound trips during the p.m. peak hour. The approximate amount of driveway trips generated by this Proposed Action alternative is 75,272 ADT with 1,998 inbound / 3,316 outbound trips during the a.m. peak hour and 4,048 inbound / 2,953 outbound trips during the p.m. peak hour.

Table 7–8 shows a summary of the total trip generation for Alternative 5: Lower-density Mixed-use Revitalization including a Transit Center. As seen in *Table 7–8*, the approximate amount of cumulative trips generated by this Proposed Action alternative is 55,309 ADT with 1,406 inbound / 2,610 outbound trips during the a.m. peak hour and 3,039 inbound / 2,031 outbound trips during the p.m. peak hour. The approximate amount of driveway trips generated by this Proposed Action alternative is 59,509 ADT with 1,482 inbound / 2,660 outbound trips during the a.m. peak hour and 3,249 inbound / 2,241 outbound trips during the p.m. peak hour.

Table 7–9 shows a summary of the total trip generation used in the Near-Term Year 2030 analysis for 25 percent of Alterative 2: Higher-density Mixed-use Revitalization. As seen in *Table 7–9*, the approximate amount of cumulative trips generated by this Proposed Action alternative is 11,951 ADT with 338 inbound / 612 outbound trips during the a.m. peak hour and 732 inbound / 461 outbound trips during the p.m. peak hour. The approximate amount of driveway trips generated by this Proposed Action alternative is 12,896 ADT with 355 inbound / 624 outbound trips during the a.m. peak hour and 779 inbound / 508 outbound trips during the p.m. peak hour.

Lastly, for the relocation of the transit center onto the site under Alternatives 4 and 5, the existing trips generated by the OTTC were rerouted to the OTC Site with added growth to arrive at Year 2050 OTTC trip generation. Per the SANDAG model runs prepared for the Project, the OTTC is expected to generate 3,200 ADT in Year 2050 that was included separately in Alternatives 4 and 5.

TABLE 7–4
ALTERNATIVE 1: NAVY RECAPITALIZATION AT OTC
TRIP GENERATION

Land Use	Daily Trip Ends (ADT)[a]	AM Peak Hour					PM Peak Hour				
		% of ADT	In:Out Split	Volume			% of ADT	In:Out Split	Volume

General Notes:
1. ADT-Average Daily Traffic, KSF-1,000 Square Feet, DU-Dwelling Unit, LN-Natural Log
2. Driveway Trips—vehicles entering and exiting project driveways (Driveway = Cumulative + Pass-By & Diverted Link)
3. Cumulative Trips—net new vehicles added to the network

Footnotes:
a. Trip ends are one-way traffic movements, either entering or leaving.
b. Trip rates obtained from the City of San Diego *Trip Generation Manual*.
c. Navy development square footage decreases from 1,683,384 SF to 1,064,268 SF.
d. Reductions obtained from the draft *City of Transportation Study Manual (TSM).*
e. Utilized 1/4 of the recommended percentage reductions on the basis that approximately 1/4 of the proposed OTC site would be within a 1,500 feet walking distance of the existing Old Town Transit Station.
f. Reductions obtained from the *City of San Diego Traffic Impact Study Manual.*

7.2 Trip Distribution & Assignment

The land uses for each of the Proposed Action alternatives were inputted in a SANDAG Series 13 Year 2050 forecast traffic model. Five (5) total traffic models were run to develop the trip distribution for the Proposed Action alternatives. A Select Zone Assignment (SZA) was prepared for each Proposed Action alternative from the traffic model, and upon review, all trip distributions were similar for the assignment of trips. Therefore, one trip distribution was used for assigning project trips for each of the Proposed Action alternatives to the street system. *Section 9.0* of this report provides additional details on the SANDAG modeling process.

Figure 7–1 shows the trip distribution used for all Proposed Action alternatives.

Figure 7–2 shows the Alternative 1: Navy Recapitalization at OTC traffic volumes.

Figure 7–3 shows the Alternative 2: Higher-density Mixed-use Revitalization traffic volumes.

Figure 7–4 shows the Alternative 3: Lower-density Mixed-use Revitalization traffic volumes.

Figure 7–5 shows the Alternative 4: Higher-density Mixed-use Revitalization including a Transit Center traffic volumes.

Figure 7–6 shows the Alternative 5: Lower-density Mixed-use Revitalization including a Transit Center traffic volumes.

Each of the above listed five figures show volumes for the ultimate traffic generated by each Proposed Action alternative.

Figure 7–7 shows the Alternative 2: Higher-density Mixed-use Revitalization (25%) traffic volumes assigned in the near-term Year 2030 condition.

8.0 CUMULATIVE CONDITIONS

Cumulative projects represent reasonably foreseeable planned development that contributes to background traffic conditions that are planned for the future, but are not yet completed and occupied at the time of the collection of existing count data used in this analysis. In determining which projects to include in the cumulative impacts analysis, a preliminary determination was made regarding the potential for a cumulative project to traverse the study area affected by the Proposed Action alternatives by the time of project occupancy. If no such potential relationship exists, the cumulative project was not carried forward into the cumulative impacts analysis.

For this transportation analysis, because the Proposed Action alternatives consist of different levels of activity, the general limit of the geographic extent of the cumulative projects and effects is also generally equivalent to the scope of for each Proposed Action alternative, for most resource areas. The geographic extent of each Proposed Action alternative is as follows:

> *Alternative 1:* Because this alternative focuses on recapitalizing the existing property, the geographic extent is equivalent to the OTC and adjacent areas (generally within one mile) and overlapping/adjacent Community Planning Areas.
>
> *Alternatives 2 and 3:* Because these alternatives consider a public-private partnership and commercial development at OTC, the geographic extent consists of the OTC, and the surrounding region (as defined by overlapping/adjacent Community Planning Areas). Though Alternatives 2 and 3 propose different densities of development, because they are similar when viewed in a cumulative impacts context, this cumulative analysis groups them together.
>
> *Alternatives 4 and 5:* Because these alternatives include the potential move of the Old Town Transit Center operations to OTC, the geographic extent for these alternatives consists of the extent associated with Alternatives 2 and 3 with the addition of cumulative projects associated with regional transportation plans, programs, and projects (e.g., automated people mover, light rail, mass transit, etc.). Though Alternatives 4 and 5 propose different densities of development, because they are similar when viewed in a cumulative impacts context, this cumulative analysis groups them together.

The cumulative transportation analysis provided in this report evaluates the incorporation of the geographic extent of all resources (i.e. Alternatives 4 & 5) given the study area extends beyond the scope or immediate area of impact associated with the Proposed Action alternatives.

Projects included in this cumulative impact analysis are summarized in ***Table 8–1*** at the end of this section. This list of identified projects generally includes projects, plans, and programs within the following categories: community development, residential construction, transportation improvements (car, train, marine, and airplane), infrastructure improvements, land and realty development/redevelopment, regular military operations and maintenance actions, military training operations, and military resource management.

8.1 Future Planning Documents

As the Proposed Action is situated in a major urban area with robust community development plans, the Navy first closely reviewed the relevant community plans located within and adjacent to the OTC. These plans include the Midway-Pacific, Old Town, Uptown, and Mission Valley Community Plans.

The following agencies were coordinated with to determine if future planning documents should be included in the list of potential cumulative projects considered in this analysis:

- Navy Base Point Loma (OTC);
- Marine Corps Recruit Depot San Diego;
- City of San Diego;
- County of San Diego;
- SANDAG;
- Port of San Diego;
- Others (San Diego International Airport, Sports Arena, etc.); and
- Projects identified through the scoping and public review process.

Upon receipt of the information from the aforementioned sources, the Navy then reviewed the provided list of projects and/or plans and then determined if those projects and/or plans merited carrying forward for cumulative impacts analysis.

8.1.1 *Military Plans*

Over 60 percent of the Navy's Pacific fleet and over 40 percent of the Marine Corps combat capability are in the San Diego area. In addition, more than 50 percent of Marine Corps recruits are trained at MCRD San Diego. Marine Corps installations and training ranges in the San Diego area, combined with the proximity to Navy installations and ranges, including NAVWAR, are essential to military readiness and are irreplaceable anywhere else in the nation (San Diego Military Advisory Council 2019).

The military has prepared installation-level plans and makes installation and regional-level considerations that reflect the whole of the military's critical and sustained presence in the greater San Diego Area. The continued synergy between military installations and complementary non-military actions is an important element in not just the continued achievement of military missions, but, the identification and implementation of past, present, and reasonably foreseeable projects by others in the region. An example of this is how the military is recognized and integrated into City of San Diego and SANDAG plans, as noted below.

8.1.2 *City of San Diego Community Plans*

The California Government Code gives local governments the authority to create land use policies within their jurisdictional boundaries and the ability to create a citywide land use and policy document called a *General Plan*. Large cities, such as San Diego, often subdivide the city into a number of community plans, or “mini” land use policy plans for more specific geographic areas. The City’s General Plan is comprised of 10 elements that provide a comprehensive slate of citywide policies and further the City of Villages smart growth strategy for growth and development (City of San Diego 2020a).

Community plans work together with the General Plan to provide location-based policies and recommendations in the City’s fifty-plus community planning areas. Community plans are written to refine the General Plan’s citywide policies, designate land uses and housing densities, and provide additional site-specific recommendations as needed. The community plans must work as part of the General Plan and must not contain policies or recommendations that are contradictory to any element of the General Plan or to other community plans (City of San Diego 2020a).

A community plan is a public document which contains specific proposals for future land uses and public improvements in a given community. A community plan provides tailored policies and a long-range physical development guide for elected officials and citizens engaged in community development.

Transportation is just one of the elements found in the Community Plan Typical elements found in a community plan include: Land Use, Transportation, Urban Design, Public Facilities and Services, Natural and Cultural Resources, and Economic Development (City of San Diego 2020b).

There are four community planning areas within or adjacent to the OTC study area:

- Midway-Pacific Highway
- Old Town San Diego
- Uptown
- Mission Valley

Each of these community planning areas have developed their own community plans, reflective of community input. The plans establish the policy framework that guides further development in pursuit of the community vision, consistent with the General Plan goals and polices. The City has also prepared companion EIRs for each of the community plans that consider the impacts associated with implementing the respective plans. The EIRs analyze the distribution and arrangement of land uses (public and private); the street, multi-modal mobility, and transit network; provision of parks and public facilities; community wide and site-specific urban design guidelines; and recommendations to preserve and enhance historic and cultural resources within the community.

Due to their breadth, depth, and reflection of a collaborative community development process, the community plans are important considerations when evaluating the potential cumulative impacts of the Proposed Action alternatives (Alternatives 1, 2, 3, 4 and 5), in conjunction with the identified cumulative projects.

8.1.3 *SANDAG Transportation Plans and Program*

SANDAG builds consensus; makes strategic plans; obtains and allocates resources; plans, engineers, and builds public transportation, and provides information on a broad range of topics pertinent to the region's quality of life. SANDAG allocates millions of dollars each year in local, state, and federal funds for the San Diego region's transportation network. Some of SANDAGs most relevant plans to the Proposed Action include the:

- 2050 Regional Transportation Plan;
- San Diego Forward: The Regional Plan;
- Regional Transportation Improvement Program; and the
- Federal Regional Transportation Plan.

In general, these plans serve as a blueprint for how the region will grow, and how SANDAG will invest in transportation infrastructure that will provide more choices, strengthen the economy, promote a healthy environment, and support thriving communities. In addition, SANDAG is exploring potential future plans that would consider development of an Automated Passenger Mover (APM) and an Intermodal Transit Center (ITC) within the region.

Due to their vision and collaborative government and community development, SANDAGs plans and programs (notably the APM and ITC) are important considerations when evaluating the potential cumulative impacts of Alternatives 4 and 5 in conjunction with the identified cumulative projects.

8.1.4 *Port of San Diego Master Plan*

For the past few years, the Port of San Diego has prepared a comprehensive integrated planning initiative to update their Port Master Plan, which is similar to a general plan for a city or county. The effort spans 6,000 acres of water and land on and around San Diego Bay in the cities of San Diego, National City, Chula Vista, Imperial Beach, and Coronado. As a blueprint for development, it is intended to create certainty for developers and community members by codifying a vision for how future projects will fulfill public goals. In the summer of 2019, the Port of San Diego released a discussion draft of the updated Port Master Plan for public review. In order to create the “next great waterfront,” it is anticipated that the updated Port Master Plan will result in additional development and changes to the roadway system. Harbor Drive is a key element of the “next great waterfront” vision.

8.1.5 *San Diego International Airport Development Plan*

In 2018, the San Diego County Regional Airport Authority (SDCRAA or Airport Authority) released the San Diego International Airport – Airport Development Plan (SDIA ADP) defining the master plan for San Diego International Airport, as part of the continued commitment to deliver world-class passenger experience and to meet existing and anticipated future passenger activity. Future forecasts project that the airport’s passenger activity will increase to 40 million annually by 2050. The Airport Authority’s Environmental Impact Report (EIR) adopted in January 2020 proposes to modernize Terminal 1 by 2026. As part of that project, the Airport Authority also proposes to develop a new on-airport entry roadway from westbound Laurel Street and North Harbor Drive for vehicles coming to the airport from the east in addition to developing a new multi-use bicycle and pedestrian path along the north side of North Harbor Drive to reduce traffic on North Harbor Drive. Buses to and from the airport Rental Car Center would be removed from Harbor Drive and routed exclusively through the new on-airport entry and link road. Separate arriving and departing passenger traffic, with an elevated departures roadway and curbside check-in would be expanded. Parking immediately adjacent to the redeveloped Terminal 1 would be expanded. Airfield improvements would include realignment of Taxiway B and a new Taxiway A to allow more efficient flow for aircraft taxiing operations.

As part of the ADP, the Airport Authority has announced a landmark pact on its transportation infrastructure investment. On July 2, 2019, the Airport Authority announced it reached a new ten-year agreement with its airline partners for a major investment in transportation infrastructure to help alleviate traffic congestion and improve access to the San Diego International Airport. This agreement outlines $350 million for on- and potentially off-airport transportation infrastructure. These funds could potentially be used for an on-airport transit station and a transit connection to the existing regional transit system. The agreement also outlines an additional $165 million for on- and off-airport access improvement plans, including an on-airport entry road connecting from Laurel Street and Harbor Drive and the construction of a bicycle path. Additionally, the airport is preserving right-of-way for a multimodal mobility corridor to serve Rapid Bus, Trolley, or an APM system that can also potentially serve Harbor Island redevelopment projects being considered by the Port of San Diego.

8.2 Automated Passenger Mover

In December 2018, SANDAG created the Airport Connectivity Subcommittee to identify future transportation solutions for improved transit and road connectivity to the San Diego International Airport. SANDAG prepared the Airport Connectivity Analysis, October 2019, which evaluates various concepts for providing seamless, direct, and quality transit connections between airports and their downtown metropolitan areas. The automated passenger mover (APM) is a technology similar to manually operated technologies, like the Trolley, except that they operate with an automated train control system. APM systems are centrally controlled with no in-vehicle drivers. For day-to-day operations, the APM systems can operate at shorter (more frequent) headways and can travel on steeper and narrower guideways than manually operated systems. The Airport Connectivity Analysis assumed an APM system operating on a fixed-guideway (track) with level-floor vehicles. These types of APM systems are used at many airports throughout the country and world.

The evaluation in the Airport Connectivity Study considered various locations for the APM including the NAVWAR OTC site and the ITC located across Pacific Highway from the Rental Car Center, just west of I-5 roughly between Washington and Vine Streets.

For the purposes of this analysis, the APM was assumed to be located at the ITC under Alternatives 1, 2, and 3. With the planned transit center include in Alternatives 4 and 5, the APM would relocate to the NAVWAR OTC site.

With the relocation of the APM to the NAVWAR OTC Site, local roadways, particularly those serving the airport, would directly benefit from a reduction in vehicular traffic oriented to/from the airport. Grape and Hawthorn are two local constrained streets in the City of San Diego's Little Italy neighborhood that experience heavy traffic volumes, mostly due to airport traffic. Shifting many of those trips onto the APM would help alleviate congestion in the immediate vicinity of the airport. For purposes of providing a conservative analysis, no quantitative benefit was taken on the study area street system with the addition of the APM.

In March 2020, WSP prepared a technical memo forecasting ridership and vehicular trip generation estimates for the APM assuming the relocation of the APM to the NAVWAR OTC site. Ridership estimates were obtained from the Airport Connectivity Analysis to forecast two concepts for the APM: Concept 1 – NAVWAR Tunnel APM; Concept 2 – NAVWAR Surface APM. For purposes of this cumulative assessment, Concept 2 was deemed appropriate and thus included in the analysis of Alternatives 4 and 5. APM Concept 2 is forecasted to generate 11,300 ADT. Trip distribution for the APM was obtained from the SDIA ADP EIR.

A copy of the WSP technical memo providing details regarding the APM assumptions can be found in ***Appendix F***.

8.3 Cumulative Projects Summary

Table 8–1 provides a summary of the cumulative projects included in the Proposed Action alternatives analysis. It should be noted that the list below includes several projects that propose network changes that may be unfunded and/or not currently programmed. Network changes that are categorized as such were excluded from the analysis. Notably, no potential upgrades to the existing roadway network were assumed in the study area analyses.

Figure 8–1 shows the locations of the cumulative projects.

General Notes:

1. The cumulative transportation analysis provided in this report evaluates the incorporation of the geographic extent of all resources (i.e. Alternatives 4 & 5) given the study area extends beyond the scope or immediate area of impact associated with the Proposed Action alternatives.
2. Map ID# equates to the cumulative project numbers shown on *Figure 8–1*. Cumulative projects not listed in *Table 8–1* were assumed to not affect the transportation resource area.

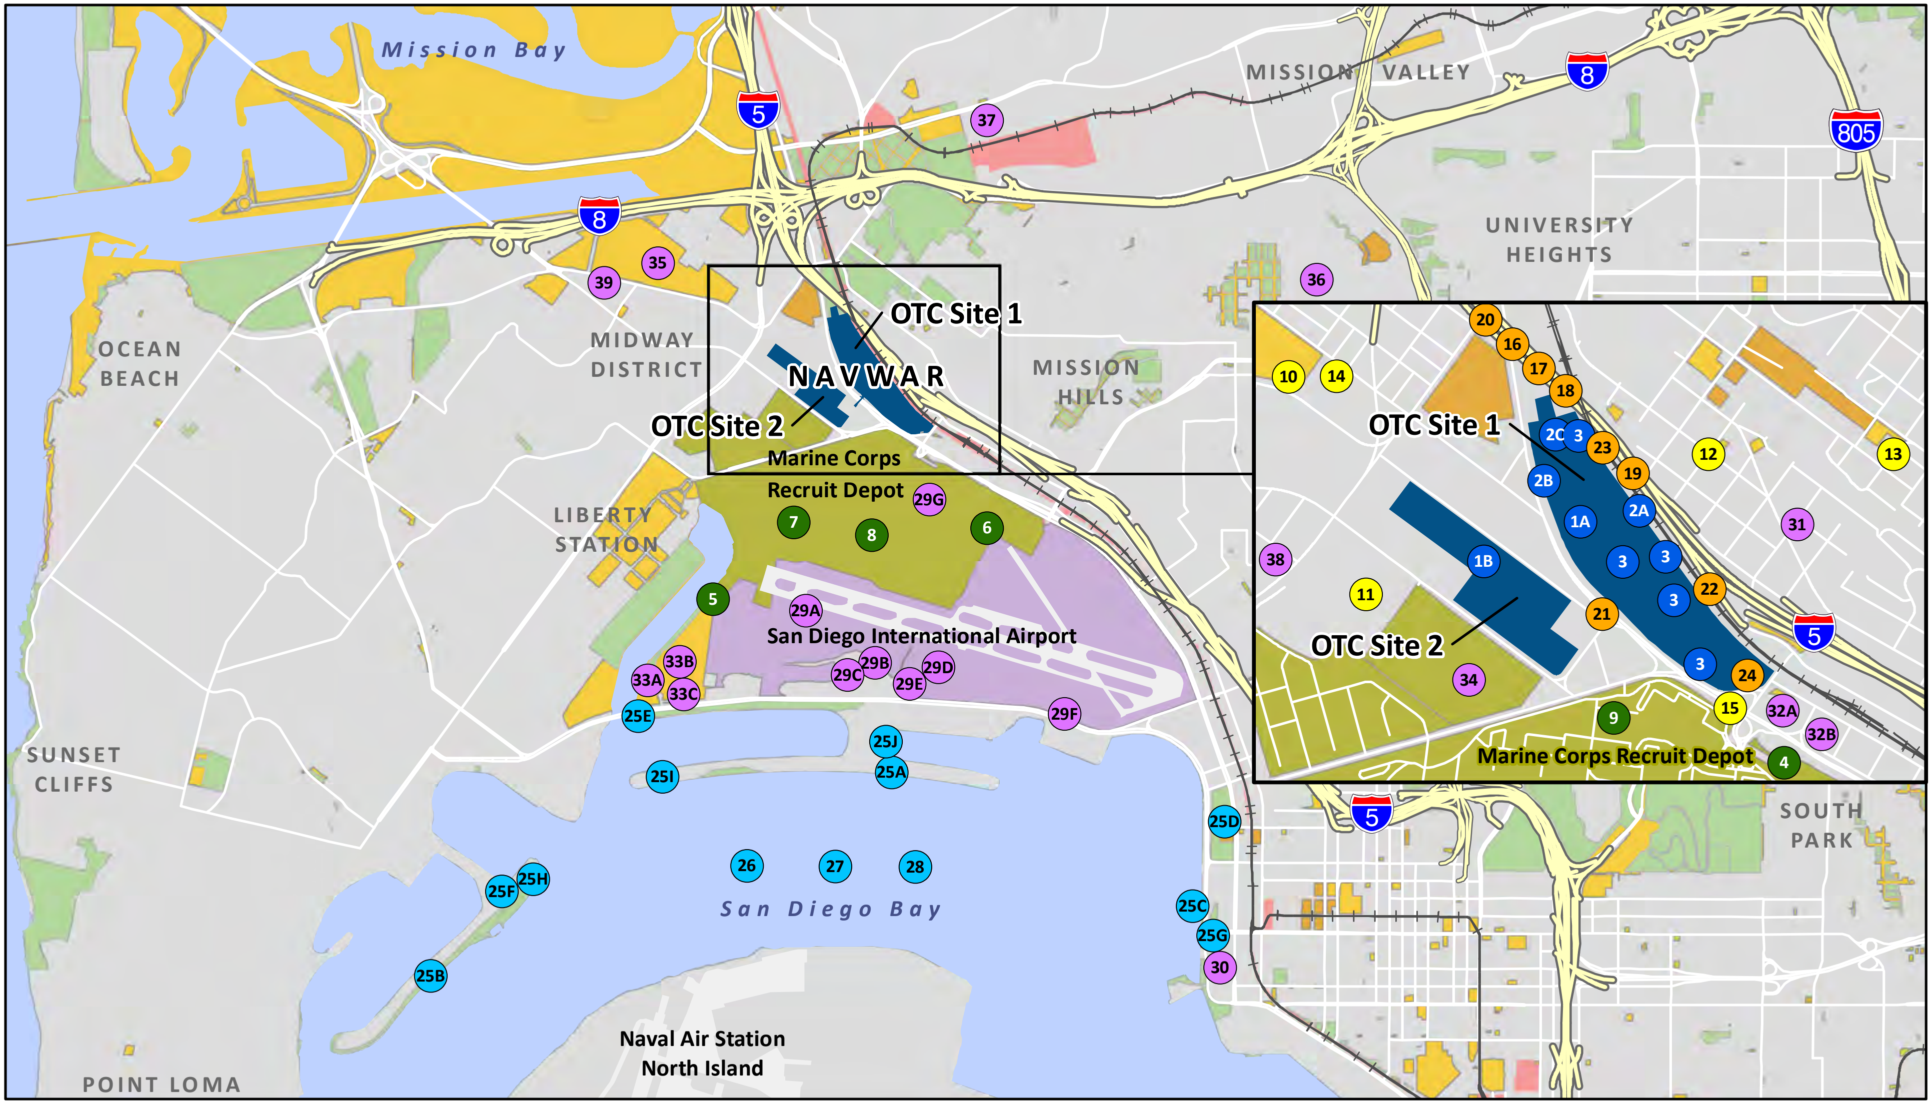

Figure 8-1 Cumulative Projects Location Map

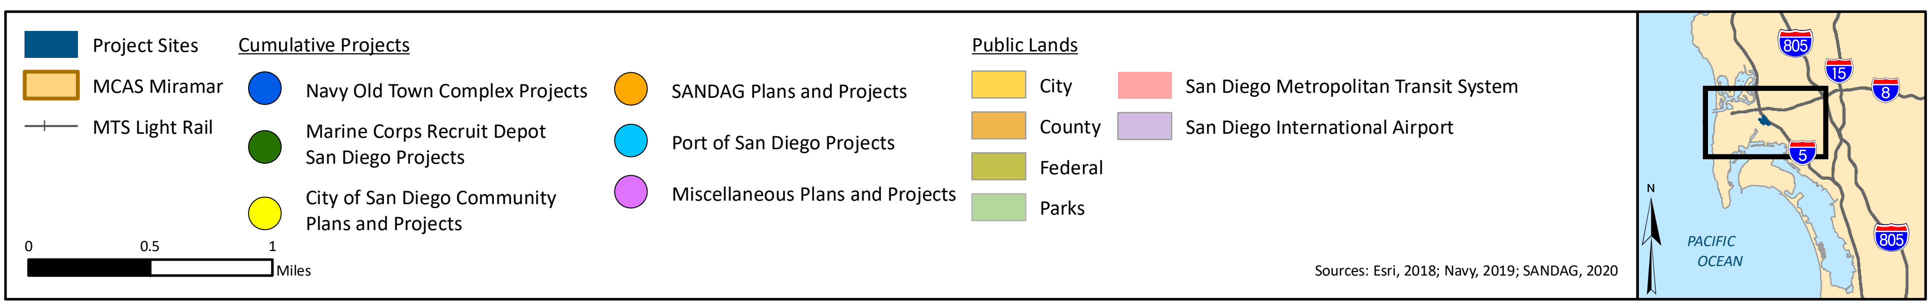

9.0 TRAFFIC MODELING

9.1 Year 2050 Traffic Volumes

9.1.1 *Year 2050 No-Action Alternative*

The Year 2050 conditions represent a future baseline with the effects of cumulative development over the existing on-the-ground conditions without development of the Proposed Action alternative. This condition is considered the Year 2050 No-Action Alternative as it assumed the existing NAVWAR operations would continue into the future. The Year 2050 No-Action Alternative parameters were developed over several months through the coordination of WSP and SANDAG. Several outside influencing factors were considered for inclusion in the forecast Year 2050. WSP and SANDAG worked with local agencies and reviewed individual cumulative development projects, Community Plans, Specific Plans, Master Plans, and Development Plans for the surrounding area. **A complete discussion of the Year 2050 cumulative condition is provided in *Section 8.0* of this report.** The results of that effort were inputted into a SANDAG Series 13 Travel Demand Model to forecast Year 2050 traffic volumes.

Appendix G contains a breakdown of the various model assumptions for the SANDAG traffic model.

Figure 9–1 shows the Year 2050 No-Action Alternative traffic volumes.

As discussed in *Section 8.0* of this report, the addition of the Automated Passenger Mover (APM) was considered a cumulative project that would be provided should a transit center be provided on the OTC site. A secondary baseline condition was developed to account for this network connection: Year 2050 No-Action Alternative with Automated Passenger Mover. Data provided by WSP for the Concept 2 Modeled Ridership was incorporated into the Year 2050 assumptions. The trip generation from the *Ridership & Trip Generation Estimates for Proposed Automated People Mover*, prepared by WSP, March 31, 2020 and the trip distribution from the Airport Development Plan were used to assign APM traffic to the study area. It should be noted the Year 2050 No-Action Alternative with APM was used as the baseline comparison for Alternative 4 and 5 which include the Project-proposed transit center.

Appendix F contains a copy of the *Ridership & Trip Generation Estimates for Proposed Automated People Mover*, prepared by WSP, March 31, 2020.

Figure 9–2 shows the Year 2050 No-Action Alternative with Automated Passenger Mover traffic volumes.

9.1.2 *Year 2050 Proposed Action Alternatives*

Section 2.0 of this report discusses the details on each alternative being considered for the Proposed Action. The land use quantities for each Proposed Action alternative were inputted into their respective Year 2050 traffic models. For Alternatives 4 and 5, a transit center was assumed to be constructed as part of the Proposed Action. In addition, with the inclusion of the transit center under

Alternatives 4 and 5, an Automated Passenger Mover was assumed as a cumulative project under Year 2050 baseline conditions.

9.1.3 *Year 2050 Traffic Volume Forecast*

Daily traffic volumes were reviewed from each the traffic models for the No-Action and Proposed Action alternatives. Once the ADTs were finalized for use in the analysis, the peak hour turning movement volumes at an intersection were estimated from Year 2050 ADT volumes using the relationship between existing peak hour turning movements and the existing ADT volumes. This same relationship can be assumed to generally continue in the future. The figures depicting traffic volumes for each Year 2050 scenario are listed below.

Figure 9–3 shows the Year 2050 with Alternative 1: Navy Recapitalization at OTC traffic volumes.

Figure 9–4 shows the Year 2050 with Alternative 2: Higher-density Mixed-use Revitalization traffic volumes.

Figure 9–5 shows the Year 2050 with Alternative 3: Lower-density Mixed-use Revitalization traffic volumes.

Figure 9–6 shows the Year 2050 with Alternative 4: Higher-density Mixed-use Revitalization including a Transit Center traffic volumes.

Figure 9–7 shows the Year 2050 with Alternative 5: Lower-density Mixed-use Revitalization including a Transit Center traffic volumes.

9.2 Near-Term Year 2030 Traffic Volumes

9.2.1 *Near-Term Year 2030 Baseline*

The Near-Term Year 2030 Baseline was developed using the Year 2050 No-Action Alternative traffic model. The annualized growth between existing Year 2020 traffic counts and the forecast Year 2050 was applied to existing ground counts for a 10-year period to arrive at baseline Year 2030 traffic volumes.

The peak hour turning movement volumes at an intersection were estimated from Year 2030 ADT volumes using the relationship between existing peak hour turning movements and the existing ADT volumes. This same relationship can be assumed to generally continue in the future.

Figure 9–8 depicts the Near-Term Year 2030 traffic volumes.

9.2.2 *Near-Term Year 2030 with Alternative 2: Higher-density Mixed-use Revitalization (25%)*

A portion of Alternative 2 Higher-density Mixed-use Revitalization represents the most intense land use development and resulting trip generation (without the transit center) that could partially develop within a 10-year timeframe. Within the 10-year timeframe, it was assumed approximately 25% of Alternative 2 would develop by Year 2030. The traffic generated under this scenario was then added to the Year 2030 baseline traffic volumes to arrive at Near-Term Year 2030 with Alternative 2: Higher-density Mixed-use Revitalization (25%) traffic volumes.

Figure 9–9 depicts the Near-Term Year 2030 with Alternative 2: Higher-density Mixed-use Revitalization (25%) traffic volumes.

10.0 YEAR 2050 NO-ACTION ALTERNATIVE ANALYSIS

The following section presents the analysis of study area intersections, street segments, freeway segments, and ramp meters under Year 2050 No-Action Alternative conditions. No changes to the street network over existing conditions were assumed in the analysis.

10.1 Peak Hour Intersection Operations

Intersection capacity analyses were conducted for the study intersections under Year 2050 No-Action Alternative conditions. ***Table 10–1*** reports the intersection operations during peak hour conditions. The following intersections are calculated to operate at LOS E or F:

- Intersection #6 Rosecrans Street & Taylor Street / Pacific Highway – LOS F during the a.m. and p.m. peak hours
- Intersection #7. Rosecrans Street / Jefferson Street – LOS E/F during the a.m./p.m. peak hours
- Intersection #8. Camino Del Rio W. / Hancock Street – LOS F during the p.m. peak hour
- Intersection #11. Rosecrans Street / Sports Arena Boulevard – LOS E during the p.m. peak hour
- Intersection #12. Rosecrans Street / Midway Drive – LOS E during the p.m. peak hour
- Intersection #13. Rosecrans Street / Lytton Street – LOS E during the a.m. and p.m. peak hours
- Intersection #14. Lytton Street & Barnett Avenue / Truxtun Road – LOS E/F during the a.m./p.m. peak hours
- Intersection #18. Pacific Highway / Kurtz Street – LOS F during the a.m. and p.m. peak hours
- Intersection #19. Pacific Highway / Sports Arena Boulevard – LOS F during the p.m. peak hour
- Intersection #20. Pacific Highway / Enterprise Street – LOS F during the a.m. and p.m. peak hours
- Intersection #22. Old Town Avenue / San Diego Avenue – LOS F/E during the a.m./p.m. peak hours
- Intersection #23. Old Town Avenue / Moore Street – LOS F during the a.m. and p.m. peak hours
- Intersection #24. Old Town Avenue / Hancock Street – LOS F during the a.m. and p.m. peak hours
- Intersection #25. Witherby Street / Hancock Street – LOS F during the p.m. peak hour
- Intersection #26. Witherby Street / Pacific Highway – LOS F during the p.m. peak hour
- Intersection #28. Hancock Street / Noell Street – LOS E/F during the a.m./p.m. peak hours

- Intersection #30. W. Washington Street / Hancock Street – LOS E during the p.m. peak hour
- Intersection #31. Washington Street / Pacific Highway (N) – LOS F during the p.m. peak hour
- Intersection #33. Pacific Highway / Sassafras Street – LOS F during the a.m. and p.m. peak hours
- Intersection #34. Pacific Highway / Laurel Street – LOS F during the a.m. and p.m. peak hours
- Intersection #35. Harbor Drive / Laurel Street – LOS F during the a.m. and p.m. peak hours
- Intersection #36. Pacific Highway / Sea World Drive – LOS F during the p.m. peak hour
- Intersection #38. Sea World Drive / I-5 NB Ramps – LOS F during the p.m. peak hour

Appendix H contains the intersection analysis worksheets for the Year 2050 No-Action Alternative scenario.

10.2 Daily Street Segment Operations

Street segment analyses were conducted for roadways in the study area under Year 2050 No-Action Alternative. ***Table 10–2*** reports the Year 2050 No-Action Alternative street segment operations on a daily basis. The following segments are calculated to operate at LOS E or F:

- Street Segment #1. Rosecrans Street: Dewey Road to Lytton Street (LOS F)
- Street Segment #2. Rosecrans Street: Lytton Street to Midway Drive (LOS F)
- Street Segment #3. Rosecrans Street: Midway Drive to Sports Arena Boulevard (LOS F)
- Street Segment #4. Rosecrans Street: Sports Arena Boulevard Kurtz Street (LOS F)
- Street Segment #5. Rosecrans Street: Kurtz Street to Pacific Highway (LOS E)
- Street Segment #9. Taylor Street: Presidio Drive to I-8 East Ramp (LOS F)
- Street Segment #11. Pacific Highway: SeaWorld Drive to Taylor St (LOS F)
- Street Segment #13. Pacific Highway: Kurtz St to Sports Arena Boulevard (LOS E)
- Street Segment #14. Pacific Highway: Sports Arena Boulevard to Barnett Avenue (LOS F)
- Street Segment #15. Pacific Highway: Barnett Avenue to Witherby Street (LOS F)
- Street Segment #16. Pacific Highway: Witherby Street to W. Washington Street (LOS F)
- Street Segment #17. Pacific Highway: W. Washington Street to Sassafras Street (LOS F)
- Street Segment #19. Morena Boulevard: Friars Road to I-8 (LOS F)
- Street Segment #20. Linda Vista Road: Morena Boulevard to Colusa Street (LOS E)
- Street Segment #21. Kurtz Street: Rosecrans Street to Pacific Highway (LOS F)
- Street Segment #26. Midway Drive: East Drive to Rosecrans Street (LOS F)
- Street Segment #27. Midway Drive: Rosecrans Street to Bogley Drive (LOS E)
- Street Segment #28. Midway Drive: Bogley Drive to Barnett Avenue (LOS E)
- Street Segment #29. Lytton Street: Rosecrans Street to St. Charles Street (LOS E)

- Street Segment #30. Barnett Avenue: St. Charles Street to Henderson Avenue (LOS F)
- Street Segment #31. Barnett Avenue: Henderson Avenue to Pacific Highway (LOS F)
- Street Segment #32. Hancock Street: Old Town Avenue to Witherby Street (LOS F)
- Street Segment #34. Hancock Street: Noell Street to W. Washington Street (LOS F)
- Street Segment #35. Washington Street: Admiral Boland Way to Pacific Highway (LOS F)

10.3 Peak Hour Freeway Segment Operations

Freeway segment analyses were conducted in the study area under Year 2050 No-Action Alternative conditions. ***Table 10–3*** reports the Year 2050 No-Action Alternative peak hour freeway segment operations. The following segments are calculated to operate at LOS E or F:

- Freeway Segment #2. I-5: I-8 to Old Town Avenue, SB (LOS E – a.m. peak) and SB (LOS E – p.m. peak)
- Freeway Segment #6. I-5: Pacific Highway Viaduct to Laurel Street, SB (LOS E – a.m. peak) and NB/SB (LOS E – p.m. peak)
- Freeway Segment #7. I-5: Laurel Street to Hawthorn Street, NB/SB (LOS E/F – a.m. peak) and NB/SB (LOS F – p.m. peak)
- Freeway Segment #8. I-5: Hawthorn Street to 1st Avenue, NB/SB (LOS E/F – a.m. peak) and NB/SB (LOS F – p.m. peak)
- Freeway Segment #9. I-5: 1st Avenue to 6th Avenue, NB/SB (LOS F – a.m. peak) and NB/SB (LOS F – p.m. peak)
- Freeway Segment #10. I-5: 6th Avenue to SR-163, SB (LOS E – a.m. peak) and NB/SB (LOS E – p.m. peak)
- Freeway Segment #12. I-8: I-5 to Morena Boulevard, WB (LOS E – a.m. peak)
- Freeway Segment #13. I-8: Morena Boulevard to Hotel Circle/Taylor Street, WB (LOS F – a.m. peak) and EB (LOS E – p.m. peak)
- Freeway Segment #14. I-8: Taylor Street to Hotel Circle, WB (LOS E – a.m. peak) and EB (LOS F – p.m. peak)
- Freeway Segment #15. I-8: Hotel Circle to SR-163, WB (LOS E – a.m. peak) and EB (LOS F – p.m. peak)

Appendix I contains the detailed HCS calculations sheets for the Year 2050 No-Action Alternative scenario.

10.4 Peak Hour Ramp Meter Operations

The Moore Street / NB I-5 on-ramp meter was analyzed under Year 2050 No-Action Alternative conditions. ***Table 10–4*** reports the Year 2050 No-Action Alternative ramp meter operations.

- Ramp Meter #1. Moore Street/ I-5 NB On-Ramp – Delays of 23/35 minutes and queues of 130/187 vehicles during the a.m. / p.m. peak hours are calculated at the *Moore Street / NB I-5 On-Ramp* under Year 2050 No-Action Alternative.

The delay at this ramp meter is more than 15 minutes. Therefore, this on-ramp is expected to operate at an unacceptable delay under Year 2050 No-Action Alternative.

Footnotes:

a. Mainline SOV lane geometry taken from PeMS lane configurations at corresponding postmile and validated against field observations.
b. See *Table 6–3* for K and D factors.
c. Passenger-car equivalent flow rate for peak 15-minute period (passenger-cars/hour/lane).
d. Per lane capacity adjusted for freeway segment geometry (passenger-cars/hour/lane).
e. V/C = (Peak Hour Volume/Hourly Capacity)
f. Density measures passenger cars per mile per lane. Density = Flow Rate (passenger-cars/hour/lane) ÷ Speed (average passenger-car speed in mph).
g. LOS = Level of Service

LOS	Density Range (pc/mi/ln)
A	0 – 11
B	> 11 – 18
C	> 18 – 26
D	> 26 – 35
E	> 35 – 45
F	> 45

General Notes:

1. Main = Mainline
2. Aux = Auxiliary
3. Truck factor sourced to most recent Caltrans Traffic Census Program *Peak Hour Volume Data* (2016).
4. "—" density exceeds the maximum threshold for LOS F.

TABLE 10–4
YEAR 2050 NO-ACTION ALTERNATIVE
RAMP METER OPERATIONS

Location / Condition	Peak Hour	Peak Hour Flow (D) (veh/hr/ln) [a]	Calculated (Most Restrictive)				
			Discharge Rate (R) (veh/hr/ln) [b]	Excess Demand (E) (veh/hr/ln) [c]	Delay (min/ln) [d]	Queue [e]	
						Feet	Vehicles
1. Moore Street / NB I-5 On-Ramp							
Year 2050 No-Action Alternative						2 SOV	
	AM	465	335	130	23	3,250	130
	PM	505	318	187	35	4,675	187

Footnotes:

a. Peak Hour Flow "D" is the traffic that desires to enter the freeway at this on-ramp during the peak hour.
b. Discharge Rate "R" is the *most restrictive* rate at which the ramp meter (signal) discharges traffic on to the freeway (See *Appendix B* for the ramp meter data obtained from Caltrans).
c. Excess Demand "E" is the difference between the Peak Hour Flow and the Discharge Rate.
d. Delay in minutes per lane experienced by each vehicle, calculated as the ratio of the Excess Demand and the Peak Hour Flow in one minute.
e. Queue per lane is reported in feet and is calculated as 25 feet per vehicle.

General Note:

1. SOV – Single Occupancy Vehicle Lane

11.0 YEAR 2050 ALTERNATIVE 1: NAVY RECAPITALIZATION AT OTC ANALYSIS

The following section presents the analysis of study area intersections, street segments, freeway segments, and ramp meters under Year 2050 conditions with the addition of Alternative 1: Navy Recapitalization at OTC traffic. For the purposes of this study, impacts identified under Year 2050 conditions are considered "cumulative" transportation impacts.

11.1 Peak Hour Intersection Operations

Intersection capacity analyses were conducted for the study intersections under Year 2050 with Alternative 1: Navy Recapitalization at OTC conditions. ***Table 11–1*** reports the intersection operations during peak hour conditions. The following intersections are calculated to operate at LOS E or F with the addition of the Proposed Action alternative:

- **Intersection #6. Rosecrans Street & Taylor Street / Pacific Highway – LOS F during the a.m. and p.m. peak hours**
- Intersection #7. Rosecrans Street / Jefferson Street – LOS E/F during the a.m./p.m. peak hours
- Intersection #8. Camino Del Rio W. / Hancock Street – LOS F during the p.m. peak hour
- Intersection #11. Rosecrans Street / Sports Arena Boulevard – LOS E during the p.m. peak hour
- Intersection #12. Rosecrans Street / Midway Drive – LOS E during the p.m. peak hour
- Intersection #13. Rosecrans Street / Lytton Street – LOS E during the a.m. and p.m. peak hours
- Intersection #14. Lytton Street & Barnett Avenue / Truxtun Road – LOS E/F during the a.m./p.m. peak hours
- **Intersection #18. Pacific Highway / Kurtz Street – LOS F during the a.m. and p.m. peak hours**
- **Intersection #19. Pacific Highway / Sports Arena Boulevard – LOS F during the p.m. peak hour**
- **Intersection #20. Pacific Highway / Enterprise Street – LOS F during the a.m. and p.m. peak hours**
- Intersection #22. Old Town Avenue / San Diego Avenue – LOS F/E during the a.m./p.m. peak hours
- **Intersection #23. Old Town Avenue / Moore Street – LOS F during the a.m. and p.m. peak hours**
- **Intersection #24. Old Town Avenue / Hancock Street – LOS F during the a.m. and p.m. peak hours**
- **Intersection #25. Witherby Street / Hancock Street – LOS F during the p.m. peak hour**
- **Intersection #26. Witherby Street / Pacific Highway – LOS F during the p.m. peak hour**
- Intersection #28. Hancock Street / Noell Street – LOS E/F during the a.m./p.m. peak hours

- Intersection #30. W. Washington Street / Hancock Street – LOS E during the p.m. peak hour
- Intersection #31. W. Washington Street / Pacific Highway (N) – LOS F during the p.m. peak hour
- Intersection #33. Pacific Highway / Sassafras Street – LOS F during the a.m. and p.m. peak hours
- Intersection #34. Pacific Highway / Laurel Street – LOS F during the a.m. and p.m. peak hours
- Intersection #35. Harbor Drive / Laurel Street – LOS F during the a.m. and p.m. peak hours
- Intersection #36. Pacific Highway / Sea World Drive – LOS F during the p.m. peak hour
- Intersection #38. Sea World Drive / I-5 NB Ramps – LOS F during the p.m. peak hour

Based on the established significance criteria, **eight significant cumulative impacts** were calculated with the addition of Alternative 1 traffic at the intersections **bolded and underlined** above since the Proposed Action alternative-induced change in delay is greater than 2.0 seconds for LOS E operating intersections and greater than 1.0 second for LOS F operating intersections.

Appendix J contains the intersection analysis worksheets for the Year 2050 with Alternative 1: Navy Recapitalization at OTC scenario.

11.2 Daily Street Segment Operations

Street segment analyses were conducted for roadways in the study area under Year 2050 with Alternative 1: Navy Recapitalization at OTC conditions. ***Table 11–2*** reports the Year 2050 with Alternative 1: Navy Recapitalization at OTC daily street segment operations. The following segments are calculated to operate at LOS E or F with the addition of the Proposed Action alternative:

- Street Segment #1. Rosecrans Street: Dewey Road to Lytton Street (LOS F)
- Street Segment #2. Rosecrans Street: Lytton Street to Midway Drive (LOS F)
- Street Segment #3. Rosecrans Street: Midway Drive to Sports Arena Boulevard (LOS F)
- Street Segment #4. Rosecrans Street: Sports Arena Boulevard to Kurtz Street (LOS F)
- Street Segment #5. Rosecrans Street: Kurtz Street to Pacific Highway (LOS E)
- Street Segment #9. Taylor Street: Presidio Drive to I-8 East Ramp (LOS F)
- Street Segment #11. Pacific Highway: SeaWorld Drive to Taylor St (LOS F)
- Street Segment #13. Pacific Highway: Kurtz Street to Sports Arena Boulevard (LOS E)
- Street Segment #14. Pacific Highway: Sports Arena Boulevard to Barnett Avenue (LOS F)
- Street Segment #15. Pacific Highway: Barnett Avenue to Witherby Street (LOS F)
- Street Segment #16. Pacific Highway: Witherby Street to W. Washington Street (LOS F)
- Street Segment #17. Pacific Highway: W. Washington Street to Sassafras Street (LOS F)
- Street Segment #19. Morena Boulevard: Friars Road to I-8 (LOS F)

- Street Segment #20. Linda Vista Road: Morena Boulevard to Colusa St (LOS E)
- Street Segment #21. Kurtz Street: Rosecrans Street to Pacific Highway (LOS F)
- Street Segment #26. Midway Drive: East Drive to Rosecrans Street (LOS F)
- Street Segment #27. Midway Drive: Rosecrans Street to Bogley Drive (LOS E)
- Street Segment #28. Midway Drive: Bogley Drive to Barnett Avenue (LOS E)
- Street Segment #29. Lytton Street: Rosecrans Street to St. Charles Street (LOS F)
- Street Segment #30. Barnett Avenue: St. Charles Street to Henderson Avenue (LOS F)
- Street Segment #31. Barnett Avenue: Henderson Avenue to Pacific Highway (LOS F)
- **Street Segment #32. Hancock Street: Old Town Avenue to Witherby Street (LOS F)**
- Street Segment #34. Hancock Street: Noell Street to W. Washington Street (LOS F)
- Street Segment #35. W. Washington Street: Admiral Boland Way to Pacific Highway (LOS F)

Based on the established significance criteria, **one significant cumulative impact** was calculated with the addition of Alternative 1 traffic on study area street segments **bolded and underlined** above since the Proposed Action alternative-induced change in V/C is greater than 0.01 for the LOS F operating street segment.

11.3 Peak Hour Freeway Segment Operations

Freeway segments were analyzed under Year 2050 with Alternative 1: Navy Recapitalization at OTC conditions. ***Tables 11–3*** and ***11–4*** report the Year 2050 with Alternative 1: Navy Recapitalization at OTC freeway segment operations during the a.m. and p.m. peak hours, respectively. The following freeway segments are calculated to operate at LOS E or F with the addition of the Proposed Action alternative:

- Freeway Segment #2. I-5: I-8 to Old Town Avenue, SB (LOS E – a.m. peak) and SB (LOS E – p.m. peak)
- Freeway Segment #6. I-5: Pacific Highway Viaduct to Laurel Street, SB (LOS E – a.m. peak) and NB/SB (LOS E – p.m. peak)
- Freeway Segment #7. I-5: Laurel Street to Hawthorn Street, NB/SB (LOS E/F – a.m. peak) and NB/SB (LOS F – p.m. peak)
- Freeway Segment #8. I-5: Hawthorn Street to 1st Avenue, NB/SB (LOS E/F – a.m. peak) and NB/SB (LOS F – p.m. peak)
- Freeway Segment #9. I-5: 1st Avenue to 6th Avenue, NB/SB (LOS F – a.m. peak) and NB/SB (LOS F – p.m. peak)
- Freeway Segment #10. I-5: 6th Avenue to SR-163, SB (LOS E – a.m. peak) and NB/SB (LOS E – p.m. peak)
- Freeway Segment #12. I-8: I-5 to Morena Boulevard, WB (LOS E – a.m. peak)
- Freeway Segment #13. I-8: Morena Boulevard to Hotel Circle/Taylor Street, WB (LOS F – a.m. peak) and EB (LOS E – p.m. peak)

- Freeway Segment #14. I-8: Taylor Street to Hotel Circle, WB (LOS E – a.m. peak) and EB (LOS F – p.m. peak)
- Freeway Segment #15. I-8: Hotel Circle to SR-163, WB (LOS E – a.m. peak) and EB (LOS F – p.m. peak)

Based on the established significance criteria, **no significant cumulative impacts** were calculated with the addition of Alternative 1 traffic on study area freeway segments since the Proposed Action alternative-induced change in V/C is greater than 0.01 for LOS E operating freeway segments and greater than 0.005 for LOS F operating freeway segments

Appendix K contains the detailed HCS calculations sheets for the Year 2050 with Alternative 1: Navy Recapitalization at OTC scenario.

11.4 Peak Hour Ramp Meter Operations

Freeway ramp meters were analyzed under Year 2050 with Alternative 1: Navy Recapitalization at OTC conditions. ***Table 11–5*** reports the Year 2050 with Alternative 1: Navy Recapitalization at OTC ramp meter operations. The following ramp meter operations are calculated with the addition of the Proposed Action alternative:

- Ramp Meter #1. Moore Street/ I-5 NB On-Ramp – Delays of 23/37 minutes and queues of 131/195 vehicles during the a.m. / p.m. peak hours are calculated.at the *Moore Street / NB I-5 On-Ramp* under Year 2050 with Alternative 1: Navy Recapitalization at OTC conditions.

Based on the established significance criteria, **no significant cumulative impacts** were calculated with the addition of Alternative 1 traffic since the increase in delay due to the Proposed Action alternative traffic does not exceed the allowable 2.0-minute threshold.

Footnotes:

a. Mainline SOV lane geometry taken from PeMS lane configurations at corresponding postmile and validated against field observations.
b. See *Table 6–3* for K and D factors.
c. Passenger-car equivalent flow rate for peak 15-minute period (passenger-cars/hour/lane).
d. Per lane capacity adjusted for freeway segment geometry (passenger-cars/hour/lane).
e. V/C = (Peak Hour Volume/Hourly Capacity)
f. Density measures passenger cars per mile per lane. Density = Flow Rate (passenger-cars/hour/lane) ÷ Speed (average passenger-car speed in mph).
g. Level of Service
h. "Δ" denotes the Proposed Action-induced increase in V/C. Per City Guidelines, a significant impact occurs when the V/C is increased by greater than 0.01 for LOS E and 0.005 for LOS F.

LOS	Density Range (pc/mi/ln)
A	0 – 11
B	> 11 – 18
C	> 18 – 26
D	> 26 – 35
E	> 35 – 45
F	> 45

General Note:

1. Main = Mainline
2. Aux = Auxiliary
3. Sig? = Significant impact, yes or no. **Bold** typeface and shading represent a significant impact.
4. "—" Indicates density exceeds the maximum threshold for LOS F.

Footnotes:

a. Mainline SOV lane geometry taken from PeMS lane configurations at corresponding postmile and validated against field observations.
b. See *Table 6–3* for K and D factors.
c. Passenger-car equivalent flow rate for peak 15-minute period (passenger-cars/hour/lane).
d. Per lane capacity adjusted for freeway segment geometry (passenger-cars/hour/lane).
e. V/C = (Peak Hour Volume/Hourly Capacity)
f. Density measures passenger cars per mile per lane. Density = Flow Rate (passenger-cars/hour/lane) ÷ Speed (average passenger-car speed in mph).
g. Level of Service
h. "Δ" denotes the Proposed Action-induced increase in V/C. Per City Guidelines, a significant impact occurs when the V/C is increased by greater than 0.01 for LOS E and 0.005 for LOS F.

LOS	Density Range (pc/mi/ln)
A	0 – 11
B	> 11 – 18
C	> 18 – 26
D	> 26 – 35
E	> 35 – 45
F	> 45

General Note:

1. M = Mainline
2. A = Auxiliary
3. Sig? = Significant impact, yes or no. **Bold** typeface and shading represent a significant impact.
4. "—" Indicates density exceeds the maximum threshold for LOS F.

TABLE 11–5
YEAR 2050 WITH ALTERNATIVE 1
RAMP METER OPERATIONS

Location / Condition	Peak Hour	Peak Hour Flow (D) (veh/hr/ln) [a]	Calculated (Most Restrictive)

	PM	505	318	187	35	4,675	187
Year 2050 With Alternative 1							2 SOV
	AM	466	335	131	23	3,275	131
	PM	513	318	195	37	4,863	195
Δ	AM			1	0	25	1
	PM			8	2	188	8

Footnotes:

a. Peak Hour Flow “D” is the traffic that desires to enter the freeway at this on-ramp during the peak hour.
b. Discharge Rate “R” is the *most restrictive* rate at which the ramp meter (signal) discharges traffic on to the freeway (See *Appendix B* for the ramp meter data obtained from Caltrans).
c. Excess Demand “E” is the difference between the Peak Hour Flow and the Discharge Rate.
d. Delay in minutes per lane experienced by each vehicle, calculated as the ratio of the Excess Demand and the Peak Hour Flow in one minute.
e. Queue per lane is reported in feet and is calculated as 25 feet per vehicle.

General Note:

1. SOV – Single Occupancy Vehicle Lane
2. Δ – Increase in delay and queue length due to the Proposed Action.

11.5 Significant Impacts and Mitigation Measures

Alternative 1: Navy Recapitalization at OTC results in the fewest impacts to study area locations. Alternative 1: Navy Recapitalization at OTC would have significant cumulative impacts at **eight (8)** intersections and **one (1)** street segment. No freeway segments or ramp meter impacts were calculated.

Physical mitigation measures are recommended for locations impacted by the Proposed Action alternative to reduce impacts to less than significant. For locations where improvements have been deemed unavoidable either due to physical constraints, right-of-way constraints, or jurisdictional constraints, it is recommended that the Proposed Action alternative contribute to implementation of Transportation Systems Management (TSM) technology to improve traffic operations along various corridors. The City of San Diego includes future traffic signal communication network elements in their Traffic Signal Communications Master Plan (2014). Part of the Master Plan would be to implement an Intelligent Transportation Systems (ITS) program on key transportation corridors within the City. ITS is a fully responsive system that can be used to benefit all modes of travel including motorists, bicyclists, pedestrians, transit and emergency vehicles. The recommendation to contribute to implementation of ITS measures for locations where significant impacts are unavoidable is included below.

Additionally, implementation of Transportation Demand Management (TDM) measures by individual projects within the OTC Site as they are developed would reduce vehicular traffic and help lessen traffic impacts on study area intersections, street segments, and freeway segments. A TDM plan is a valuable tool to reducing single-occupancy vehicle (SOV) trips and therefore recommended for the Proposed Action alternatives. Further details on TDM and TSM measures are provided later on in *Sections 27.0 and 28.0* of this report, respectively.

Table 11–5 lists the significantly impacted locations and proposed mitigation measures.

Figure 11–1 shows an illustration of the significantly impacted locations.

TABLE 11–5
YEAR 2050 WITH ALTERNATIVE 1 SIGNIFICANT IMPACTS AND MITIGATION MEASURES

ID	#	Location	Jur.	Mitigation Measures	Mit.? (Y/N)
INTERSECTIONS					
Alt 1-I-1	6	Pacific Hwy/ Rosecrans St/ Taylor St	San Diego	Per the Midway-Pacific Highway Community Plan, improvements are planned at this intersection. The Community Plan proposes to provide a second southbound left-turn lane, a westbound right-turn overlap phase, and a second northbound right-turn lane. Implementation of the Community Plan improvements would mitigate the impact to below a level of significance.	Yes
Alt 1-I-2	18	Pacific Hwy/ Kurtz St	San Diego	Per the Midway-Pacific Highway Community Plan, improvements are planned at this intersection to reconfigure the existing geometry. The Community Plan proposes to signalize the intersection and allow eastbound left-turn movements. Therefore, it is recommended the Proposed Action alternative implement the Community Plan improvements to mitigate the impact to below a level of significance.	Yes
Alt 1-I-3	19	Sports Arena Blvd/ Pacific Hwy	San Diego	Per the Midway-Pacific Highway Community Plan, improvements are planned at this intersection to reconfigure the existing geometry. The Community Plan proposes to relocate the intersection 500 feet to the north of its current location. Improvements to realign Sports Arena Boulevard to create a right-angle with Pacific Highway are planned, as well as signalizing the intersection, providing an exclusive eastbound left-turn lane from Sports Arena Boulevard onto Pacific Highway and providing a northbound left-turn lane from Pacific Highway onto Sports Arena Boulevard. With the improvements proposed at this intersection, the Community Plan reports LOS C results. With the additional traffic added by the Proposed Action alternative, acceptable LOS operations would continue to occur. Therefore, it is recommended the Proposed Action alternative implement the Community Plan improvements to mitigate the impact to below a level of significance.	Yes
Alt 1-I-4	20	Pacific Hwy/ Enterprise St	San Diego	There are no planned improvements in the Midway-Pacific Highway Community Plan at this intersection. This intersection currently serves as an access point for the existing NAVWAR OTC Site. With future development of the Proposed Action alternative, this intersection would likely be improved to provide additional lanes entering/exiting the site. However, additional lanes would be needed on Pacific Highway. Any widening to Pacific Highway would be infeasible due to lack of right-of-way. Therefore, the impact at this intersection will remain significant and unavoidable. Given that the impact at this location remains significant and unavoidable, it is recommended the Proposed Action alternative prepare a TDM plan as outlined in *Section 27.0* of this report and participate in the implementation of TSM measures described in *Section 28.0*. These measures will partially mitigate this significant impact.	No

TABLE 11–5
YEAR 2050 WITH ALTERNATIVE 1 SIGNIFICANT IMPACTS AND MITIGATION MEASURES

ID	#	Location	Jur.	Mitigation Measures	Mit.? (Y/N)
Alt 1-I-5	23	Old Town Ave/ Moore St	San Diego	Per the Old Town Community Plan, improvements are recommended at this intersection. The Community Plan recommends signal phasing be changed from permissive to protected and to add exclusive left-turn lanes on Old Town Avenue approaching the intersection. However, the Community Plan concludes there is no available right-of-way to complete the improvements. Given that the impact at this location remains significant and unavoidable, it is recommended the Proposed Action alternative prepare a TDM plan as outlined in *Section 27.0* of this report and participate in the implementation of TSM measures described in *Section 28.0*. These measures will partially mitigate this significant impact.	No
Alt 1-I-6	24	Hancock St/ Old Town Ave/ I-5 SB Off-Ramps	San Diego	There are no planned improvements in the Midway-Pacific Highway Community Plan at this intersection. Installation of a traffic signal at this intersection would improve operations at this intersection. However, the intersection is located less than 100 feet from the I-5 southbound on-ramp, which would be less than ideal for installing a signal without reconfiguring the both the intersection and the on-ramp. Based on these findings, no improvements are recommended and the impact at this intersection remains significant and unavoidable. Given that the impact at this location remains significant and unavoidable, it is recommended the Proposed Action alternative prepare a TDM plan as outlined in *Section 27.0* of this report and participate in the implementation of TSM measures described in *Section 28.0*. These measures will partially mitigate this significant impact.	No
Alt 1-I-7	25	Witherby St/ Hancock St	San Diego	Per the Midway-Pacific Highway Community Plan, improvements are planned at this intersection to reconfigure the existing geometry. The Community Plan proposes to widen the northbound approach to provide one shared through/right-turn lane and one shared through/left-turn lane. Therefore, it is recommended the Proposed Action alternative implement the Community Plan improvements to mitigate the impact to below a level of significance.	Yes
Alt 1-I-8	26	Witherby St/ Pacific Hwy	San Diego	Per the Midway-Pacific Highway Community Plan, improvements are planned at this intersection to reconfigure the existing geometry. The Community Plan proposes to remove the grade separation between Witherby Street, Pacific Highway, and Tripoli Avenue and construct an at-grade four-way signalized allowing for full movements. The Community Plan does not further analyze these improvements or discuss their feasibility. Based on these findings, no improvements are recommended and the impact at this intersection remains significant and unavoidable. Given that the impact at this location remains significant and unavoidable, it is recommended the Proposed Action alternative prepare a TDM plan as outlined in *Section 27.0* of this report and participate in the implementation of TSM measures described in *Section 28.0*. These measures will partially mitigate this significant impact.	No

STREET SEGMENTS					
		Hancock Street			
Alt 1-S-1	32	Old Town Ave to Witherby St	San Diego	Per the Midway-Pacific Highway Community Plan, improvements are planned along this street segment to reconfigure the existing geometry. This segment of Hancock Street currently functions as a two-lane Collector with a LOS E capacity of 8,000 ADT. The Community Plan classifies this segment of the roadway as a four-lane Collector with a LOS E capacity of 15,000 ADT. This results in an additional 7,000 ADT of capacity over existing conditions. Implementation of the Community Plan improvements would mitigate the impact to below a level of significance.	Yes

General Notes:

1. Jur. = Jurisdiction
2. Mit. = Mitigated Impact, yes or no?

12.0 YEAR 2050 WITH ALTERNATIVE 2: HIGHER-DENSITY MIXED-USE REVITALIZATION ANALYSIS

The following section presents the analysis of study area intersections, street segments, freeway segments, and ramp meters under Year 2050 conditions with the addition of Alternative 2: Higher-density Mixed-Use Revitalization traffic. No changes to the street network over existing conditions were assumed in the analysis. For the purposes of this study, impacts identified under Year 2050 conditions are considered "cumulative" transportation impacts.

12.1 Peak Hour Intersection Operations

Intersection capacity analyses were conducted for the study intersections under Year 2050 with Alternative 2: Higher-density Mixed-use Revitalization conditions. ***Table 12–1*** reports the intersection operations during peak hour conditions. The following intersections are calculated to operate at LOS E or F with the addition of the Proposed Action alternative:

- **Intersection #2. Taylor Street / I-8 EB Ramps – LOS E during the p.m. peak hour**
- **Intersection #6. Rosecrans Street & Taylor Street / Pacific Highway – LOS F during the a.m. and p.m. peak hours**
- **Intersection #7. Rosecrans Street / Jefferson Street – LOS E/F during the a.m./p.m. peak hours**
- **Intersection #8. Camino Del Rio W. / Hancock Street – LOS E/F during the a.m./p.m. peak hours**
- **Intersection #11. Rosecrans Street / Sports Arena Boulevard – LOS E/F during the a.m./p.m. peak hours**
- **Intersection #12. Rosecrans Street / Midway Drive – LOS E during the p.m. peak hour**
- **Intersection #13. Rosecrans Street / Lytton Street – LOS F/E during the a.m./p.m. peak hours**
- **Intersection #14. Lytton Street & Barnett Avenue / Truxtun Road – LOS E/F during the a.m./p.m. peak hours**
- **Intersection #15. Midway Drive / Enterprise Street – LOS F during the a.m. and p.m. peak hours**
- **Intersection #16. Midway Drive / Barnett Avenue – LOS F during the p.m. peak hour**
- **Intersection #18. Pacific Highway / Kurtz Street – LOS F during the a.m. and p.m. peak hours**
- **Intersection #19. Pacific Highway / Sports Arena Boulevard – LOS F during the a.m. and p.m. peak hours**
- **Intersection #20. Pacific Highway / Enterprise Street – LOS F during the a.m. and p.m. peak hours**
- **Intersection #22. Old Town Avenue / San Diego Avenue – LOS F/E during the a.m./p.m. peak hours**

- **Intersection #23. Old Town Avenue / Moore Street – LOS F during the a.m. and p.m. peak hours**
- **Intersection #24. Old Town Avenue / Hancock Street – LOS F during the a.m. and p.m. peak hours**
- **Intersection #25. Witherby Street / Hancock Street – LOS F during the a.m. and p.m. peak hours**
- **Intersection #26. Witherby Street / Pacific Highway – LOS F during the a.m. and p.m. peak hours**
- **Intersection #27. Witherby Street / Tripoli Avenue – LOS F during the a.m. and p.m. peak hours**
- **Intersection #28. Hancock Street / Noell Street – LOS E/F during the a.m./p.m. peak hours**
- **Intersection #30. W. Washington Street / Hancock Street – LOS E during the p.m. peak hour**
- Intersection #31. W. Washington Street / Pacific Highway (N) – LOS F during the p.m. peak hour
- **Intersection #33. Pacific Highway / Sassafras Street – LOS F during the a.m. and p.m. peak hours**
- **Intersection #34. Pacific Highway / Laurel Street – LOS F during the a.m. and p.m. peak hours**
- **Intersection #35. Harbor Drive / Laurel Street – LOS F during the a.m. and p.m. peak hours**
- **Intersection #36. Pacific Highway / Sea World Drive – LOS F during the a.m. and p.m. peak hours**
- Intersection #38. Sea World Drive / I-5 NB Ramps – LOS F during the p.m. peak hour

Based on the established significance criteria, **25 significant cumulative impacts** were calculated with the addition of Alternative 2 traffic at the intersections **bolded and underlined** above since the Proposed Action alternative-induced change in delay is greater than 2.0 seconds for LOS E operating intersections and greater than 1.0 second for LOS F operating intersections.

Appendix L contains the intersection analysis worksheets for the Year 2050 with Alternative 2: Higher-density Mixed-use Revitalization scenario.

12.2 Daily Street Segment Operations

Street segment analyses were conducted for roadways in the study area under Year 2050 with Alternative 2: Higher-density Mixed-use Revitalization conditions. ***Table 12–2*** reports the Year 2050 with Alternative 2: Higher-density Mixed-use Revitalization daily street segment operations. The following segments are calculated to operate at LOS E or F with the addition of the Proposed Action alternative:

- **<u>Street Segment #1. Rosecrans Street: Dewey Road to Lytton Street (LOS F)</u>**
- **<u>Street Segment #2. Rosecrans Street: Lytton Street to Midway Drive (LOS F)</u>**
- **<u>Street Segment #3. Rosecrans Street: Midway Drive to Sports Arena Boulevard (LOS F)</u>**
- **<u>Street Segment #4. Rosecrans Street: Sports Arena Boulevard to Kurtz Street (LOS F)</u>**
- **<u>Street Segment #5. Rosecrans Street: Kurtz Street to Pacific Highway (LOS E)</u>**
- **<u>Street Segment #9. Taylor Street: Presidio Drive to I-8 East Ramp (LOS F)</u>**
- **<u>Street Segment #11. Pacific Highway: SeaWorld Drive to Taylor Street (LOS F)</u>**
- **<u>Street Segment #13. Pacific Highway: Kurtz St to Sports Arena Boulevard (LOS F)</u>**
- **<u>Street Segment #14. Pacific Highway: Sports Arena Boulevard to Barnett Avenue (LOS F)</u>**
- **<u>Street Segment #15. Pacific Highway: Barnett Avenue to Witherby Street (LOS F)</u>**
- **<u>Street Segment #16. Pacific Highway: Witherby Street to W. Washington Street (LOS F)</u>**
- **<u>Street Segment #17. Pacific Highway: W. Washington Street to Sassafras Street (LOS F)</u>**
- **<u>Street Segment #19. Morena Boulevard: Friars Road to I-8 (LOS F)</u>**
- **<u>Street Segment #20. Linda Vista Road: Morena Boulevard to Colusa Street (LOS F)</u>**
- **<u>Street Segment #21. Kurtz Street: Rosecrans Street to Pacific Highway (LOS F)</u>**
- **<u>Street Segment #25. Sports Arena Boulevard: Rosecrans Street to Enterprise Street (LOS E)</u>**
- **<u>Street Segment #26. Midway Drive: East Drive to Rosecrans Street (LOS F)</u>**
- **<u>Street Segment #27. Midway Drive: Rosecrans Street to Bogley Drive (LOS F)</u>**
- **<u>Street Segment #28. Midway Drive: Bogley Drive to Barnett Avenue (LOS F)</u>**
- **<u>Street Segment #29. Lytton Street: Rosecrans Street to St. Charles Street (LOS F)</u>**
- **<u>Street Segment #30. Barnett Avenue: St. Charles Street to Henderson Avenue (LOSF)</u>**
- **<u>Street Segment #31. Barnett Avenue: Henderson Avenue to Pacific Highway (LOS F)</u>**
- **<u>Street Segment #32. Hancock Street: Old Town Avenue to Witherby Street (LOS F)</u>**
- **<u>Street Segment #33. Hancock Street: Witherby Street Noell Street (LOS E)</u>**
- Street Segment #34. Hancock Street: Noell Street to W. Washington Street (LOS F)

- Street Segment #35. W. Washington Street: Admiral Boland Way to Pacific Highway (LOS F)
- **Street Segment #37. W. Washington Street: Hancock Street to W. University Avenue (LOS E)**

Based on the established significance criteria, **25 significant cumulative impact** were calculated with the addition of Alternative 2 traffic on study area street segments **bolded and underlined** above since the Proposed Action alternative-induced change in V/C is greater than 0.02 for LOS E operating street segments and greater than 0.01 for LOS F operating street segments.

12.3 Peak Hour Freeway Segment Operations

Freeway segments were analyzed under Year 2050 with Alternative 2: Higher-density Mixed-use Revitalization conditions. ***Tables 12–3*** and ***12–4*** report the Year 2050 with Alternative 2: Higher-density Mixed-use Revitalization freeway segment operations during the a.m. and p.m. peak hours, respectively. The following freeway segments are calculated to operate at LOS E or F with the addition of the Proposed Action alternative:

- **Freeway Segment #2. I-5: I-8 to Old Town Avenue, SB (LOS E – a.m. peak) and NB/SB (LOS E – p.m. peak)**
- **Freeway Segment #6. I-5: Pacific Highway Viaduct to Laurel Street, NB/SB (LOS E/F – a.m. peak) and NB/SB (LOS F – p.m. peak)**
- **Freeway Segment #7. I-5: Laurel Street to Hawthorn Street, NB/SB (LOS F – a.m. peak) and NB/SB (LOS F – p.m. peak)**
- **Freeway Segment #8. I-5: Hawthorn Street to 1st Avenue, NB/SB (LOS F – a.m. peak) and NB/SB (LOS F – p.m. peak)**
- **Freeway Segment #9. I-5: 1st Avenue to 6th Avenue, NB/SB (LOS F – a.m. peak) and NB/SB (LOS F – p.m. peak)**
- **Freeway Segment #10. I-5: 6th Avenue to SR-163, NB/SB (LOS E/F – a.m. peak) and NB/SB (LOS E/F – p.m. peak)**
- **Freeway Segment #12. I-8: I-5 to Morena Boulevard, WB (LOS E – a.m. peak)**
- **Freeway Segment #13. I-8: Morena Boulevard to Hotel Circle/Taylor Street, WB (LOS F – a.m. peak) and EB (LOS E – p.m. peak)**
- **Freeway Segment #14. I-8: Taylor Street to Hotel Circle, WB (LOS E – a.m. peak) and EB (LOS F – p.m. peak)**
- **Freeway Segment #15. I-8: Hotel Circle to SR-163, EB/WB (LOS E – a.m. peak) and EB (LOS F – p.m. peak)**

Based on the established significance criteria, **ten significant cumulative impacts** were calculated with the addition of Alternative 2 traffic on study area freeway segments **bolded and underlined** above since the Proposed Action alternative-induced change in V/C is greater than 0.01 for LOS E operating freeway segments and greater than 0.005 for LOS F operating freeway segments

Appendix M contains the detailed HCS calculations sheets for the Year 2050 with Alternative 2: Higher-density Mixed-use Revitalization scenario.

12.4 Peak Hour Ramp Meter Operations

The Moore Street / NB I-5 on-ramp meter was analyzed under Year 2050 with Alternative 2: Higher-density Mixed-use Revitalization. ***Table 12–5*** reports the Year 2050 Alternative 2: Higher-density Mixed-use Revitalization ramp meter operations.

- **<u>Ramp Meter #1. Moore Street/ I-5 NB On-ramp</u>** – Delays of 70/78 minutes and queues of 390/413 vehicles during the a.m. / p.m. peak hours are calculated.at the *Moore Street / NB I-5 On-Ramp* under Year 2050 with Alternative 2: Higher-density Mixed-use Revitalization conditions.

Based on the established significance criteria, **<u>one (1) significant cumulative impact</u>** was calculated with the addition of Alternative 2 traffic at the location **<u>bolded and underlined</u>** above since the total delay at this on ramp is more than 15 minutes during the a.m. and p.m. peak hours and the increase in the delay at the ramp meter is greater than 2.0 minutes.

Footnotes:

a. Mainline SOV lane geometry taken from PeMS lane configurations at corresponding postmile and validated against field observations.
b. See *Table 6–3* for K and D factors.
c. Passenger-car equivalent flow rate for peak 15-minute period (passenger-cars/hour/lane).
d. Per lane capacity adjusted for freeway segment geometry (passenger-cars/hour/lane).
e. V/C = (Peak Hour Volume/Hourly Capacity)
f. Density measures passenger cars per mile per lane. Density = Flow Rate (passenger-cars/hour/lane) ÷ Speed (average passenger-car speed in mph).
g. Level of Service
h. "Δ" denotes the Proposed Action-induced increase in V/C. Per City Guidelines, a significant impact occurs when the V/C is increased by greater than 0.01 for LOS E and 0.005 for LOS F.

LOS	Density Range (pc/mi/ln)
A	0 – 11
B	> 11 – 18
C	> 18 – 26
D	> 26 – 35
E	> 35 – 45
F	> 45

General Note:

1. M = Mainline
2. A = Auxiliary
3. Sig? = Significant impact, yes or no. Bold typeface and shading represent a significant impact.
4. "—" Indicates density exceeds the maximum threshold for LOS F.

						Feet	Vehicles
1. Moore Street / NB I-5 On-Ramp							
Year 2050 No-Action Alternative							2 SOV
	AM	465	335	130	23	3,250	130
	PM	505	318	187	35	4,675	187
Year 2050 with Alternative 2							2 SOV
	AM	725	335	390	70	9,738	390
	PM	731	318	413	78	10,313	413
Δ	**AM**			**260**	**46**	**6,488**	**260**
	PM			**226**	**43**	**5,638**	**226**

Footnotes:

a. Peak Hour Flow "D" is the traffic that desires to enter the freeway at this on-ramp during the peak hour.
b. Discharge Rate "R" is the *most restrictive* rate at which the ramp meter (signal) discharges traffic on to the freeway (See *Appendix B* for the ramp meter data obtained from Caltrans).
c. Excess Demand "E" is the difference between the Peak Hour Flow and the Discharge Rate.
d. Delay in minutes per lane experienced by each vehicle, calculated as the ratio of the Excess Demand and the Peak Hour Flow in one minute.
e. Queue per lane is reported in feet and is calculated as 25 feet per vehicle.

General Note:

1. SOV – Single Occupancy Vehicle Lane
2. Δ – Increase in delay and queue length due to the Proposed Action.
3. **Bold** typeface and shading represent a significant impact.

12.5 Significant Impacts and Mitigation Measures

Alternative 2 results in the same significant cumulative impacts as Alternative 1 with the addition of newly impacted locations under this Proposed Action alternative. Alternative 2: Higher-density Mixed-use Revitalization would have significant cumulative impacts at **25** intersections, on **24** street segments, on **10** freeways segments, and at **one (1)** ramp meter.

Physical mitigation measures are recommended for locations impacted by the Proposed Action alternative to reduce impacts to less than significant. Together with Caltrans, SANDAG has prepared a concept plan for reconstructing the I-5/Old Town Avenue interchange that would improve access to the OTC Site as well as reduce area traffic on local streets. This network improvement is proposed as mitigation for several impacted locations. As part of this major infrastructure improvement, the existing I-5/Old Town Avenue interchange would be replaced with a new bridge and reconfigured on- and off-ramps. This project would include: a high-occupancy vehicle (HOV) direct access ramp into the future on-site transit center to/from southbound I-5 (only under the Alternative 4 and Alternative 5 scenarios where the transit center is consolidated on the OTC Site); direct access ramps to the OTC Site to/from I-5, the reconstruction and widening of the I-5/Old Town Avenue interchange; and the realignment and signalization of the Pacific Highway/Barnett Avenue intersection. With the enhanced capacity of the new interchange and direct access to the site, traffic volumes accessing the OTC Site would shift to the new interchange, thus reducing volumes on Pacific Highway, Camino Del Rio W., Hancock Street, Witherby Street and surrounding surface streets. A concept plan showing this improvement is depicted later on in *Section 29.0* of this report.

For locations where improvements have been deemed unavoidable either due to physical constraints, right-of-way constraints, or jurisdictional constraints and where the reconstructed interchange would not fully mitigate, it is recommended that the Proposed Action alternative contribute to the implementation of Transportation Systems Management (TSM) technology to improve traffic operations along various corridors. The City of San Diego includes future traffic signal communication network elements in their Traffic Signal Communications Master Plan (2014). Part of the Master Plan would be to implement an Intelligent Transportation Systems (ITS) program on key transportation corridors within the City. ITS is a fully responsive system that can be used to benefit all modes of travel including motorists, bicyclists, pedestrians, transit and emergency vehicles. The recommendation to contribute to implementation of ITS measures for locations where significant impacts are unavoidable is included below.

Additionally, implementation of Transportation Demand Management (TDM) measures by individual projects within the OTC Site as they are developed would reduce vehicular traffic and help lessen traffic impacts on study area intersections, street segments, and freeway segments. A TDM plan is a valuable tool to reducing single-occupancy vehicle (SOV) trips and therefore recommended for the Proposed Action alternatives. Further details on TDM and TSM measures are provided later on in *Sections 27.0 and 28.0* of this report, respectively.

Table 12–5 lists the significantly impacted locations and proposed mitigation measures.

Figure 12–1 shows an illustration of the significantly impacted locations.

TABLE 12–5
YEAR 2050 WITH ALTERNATIVE 2 SIGNIFICANT IMPACTS AND MITIGATION MEASURES

ID	#	Location	Jur.	Mitigation Measures	Mit.? (Y/N)
INTERSECTIONS					
Alt 2-I-1	2	Taylor St/ I-8 EB Ramps	San Diego/ Caltrans	Per the Mission Valley Community Plan, the entirety of Hotel Circle will be transformed from a bi-directional collector to a one-way couplet running in the clockwise direction. As part of this network change, the Taylor Street/I-8 Eastbound Ramps interchange will be eliminated and replaced by a new signalized interchange at I-8 with the future connection of Via Las Cumbres. Given the unknown timing for implementation and the lack of an identified funding source in the Mission Valley Community Plan, the impact at this intersection remains significant and unavoidable. Given that the impact at this location remains significant and unavoidable, it is recommended the Proposed Action alternative prepare a TDM plan as outlined in *Section 27.0* of this report and participate in the implementation of TSM measures described in *Section 28.0*. These measures will partially mitigate this significant impact.	No
Alt 2-I-2	6	Pacific Hwy/ Rosecrans St/ Taylor St	San Diego	Per the Midway-Pacific Highway Community Plan, improvements are planned at this intersection. The Community Plan proposes to provide a second southbound left-turn lane, a westbound right-turn overlap phase, and a second northbound right-turn lane. Implementation of the Community Plan improvements would mitigate the impact to below a level of significance. Alternatively, together with Caltrans, SANDAG has prepared a concept plan for reconstructing the I-5/Old Town Avenue interchange. As part of this major infrastructure improvement, the existing I-5/Old Town Avenue interchange would be replaced with a new bridge and reconfigured on- and off-ramps. This project would include: a high-occupancy vehicle (HOV) direct access ramp into the future on-site transit center to/from southbound I-5; direct access ramps to the OTC Site to/from I-5, the reconstruction and widening of the I-5/Old Town Avenue interchange; and the realignment and signalization of the Pacific Highway/Barnett Avenue intersection. With the enhanced capacity of the new interchange and direct access to the site, traffic volumes accessing the OTC Site would shift to the new interchange, thus reducing volumes on Pacific Highway, Camino Del Rio W., Hancock Street, Witherby Street and surrounding surface streets. Construction of the interchange improvements would mitigate the impact to below a level of significance.	Yes

TABLE 12–5
YEAR 2050 WITH ALTERNATIVE 2 SIGNIFICANT IMPACTS AND MITIGATION MEASURES

ID	#	Location	Jur.	Mitigation Measures	Mit.? (Y/N)
Alt 2-I-3	7	Rosecrans St/ Jefferson St	San Diego	There are no planned improvements in the Midway-Pacific Highway Community Plan at this intersection. Installation of a traffic signal at this intersection would improve operations at this intersection. However, the intersection is located within close proximity to the Rosecrans Street/Taylor Street/ Pacific Highway signalized intersection (350 feet) which would be less than ideal for installing a signal and it would not be expected that the intersection would meet signal warrants given the very low minor street volumes on Jefferson Street. The provision of an additional signal on this segment of Rosecrans Street where heavy through traffic is observed would not be beneficial to the major street traffic flow. Based on these findings, no improvements are recommended and the impact at this intersection remains significant and unavoidable. Given that the impact at this location remains significant and unavoidable, it is recommended the Proposed Action alternative prepare a TDM plan as outlined in *Section 27.0* of this report and participate in the implementation of TSM measures described in *Section 28.0*. These measures will partially mitigate this significant impact.	No
Alt 2-I-4	8	Camino Del Rio W/ Hancock St	San Diego	The intersection is built out with regard to available right-of-way. Additional through lanes on Camino Del Rio West are needed to improve operations at this intersection. However, given the lack of available right-of-way, widening at this intersection is infeasible. Together with Caltrans, SANDAG has prepared a concept plan for reconstructing the I-5/Old Town Avenue interchange. As part of this major infrastructure improvement, the existing I-5/Old Town Avenue interchange would be replaced with a new bridge and reconfigured on- and off-ramps. This project would include: a high-occupancy vehicle (HOV) direct access ramp into the future on-site transit center to/from southbound I-5; direct access ramps to the OTC Site to/from I-5, the reconstruction and widening of the I-5/Old Town Avenue interchange; and the realignment and signalization of the Pacific Highway/Barnett Avenue intersection. With the enhanced capacity of the new interchange and direct access to the site, traffic volumes accessing the OTC Site would shift to the new interchange, thus reducing volumes on Pacific Highway, Camino Del Rio W., Hancock Street, Witherby Street and surrounding surface streets. Construction of the interchange improvements would mitigate the impact to below a level of significance.	Yes

TABLE 12–5
YEAR 2050 WITH ALTERNATIVE 2 SIGNIFICANT IMPACTS AND MITIGATION MEASURES

ID	#	Location	Jur.	Mitigation Measures	Mit.? (Y/N)
Alt 2-I-5	11	Rosecrans St/ Sports Arena Blvd/ Camino Del Rio W	San Diego	Per the Midway-Pacific Highway Community Plan, improvements are planned at this intersection to reconfigure the existing geometry. The Community Plan proposes to remove the southbound free right-turn movement from Camino Del Rio West onto Sports Arena Boulevard and replace it with an exclusive right-turn lane. The planned improvements allow southbound movements to continue on Sports Arena Boulevard through the intersection. Notably, vehicles would still not be able to access the southern leg of Sports Arena Boulevard from westbound Rosecrans Street or southwest bound Camino del Rio West. With the improvements proposed at this intersection, the Community Plan reports LOS D results. The additional traffic added by the Proposed Action alternative would degrade intersection operations to significant levels. Any improvements beyond those recommended in the Community Plan are physically infeasible given the lack of available right-of-way. Therefore, it is recommended the Proposed Action alternative implement the Community Plan improvements, where feasible, and the impact at this intersection will remain significant and unavoidable. Given that the impact at this location remains significant and unavoidable, it is recommended the Proposed Action alternative prepare a TDM plan as outlined in *Section 27.0* of this report and participate in the implementation of TSM measures described in *Section 28.0*. These measures will partially mitigate this significant impact.	No
Alt 2-I-6	12	Rosecrans St/ Midway Dr	San Diego	Per the Midway-Pacific Highway Community Plan, improvements are planned at this intersection. The Community Plan proposes an exclusive southbound right-turn lane with an overlap phase, a westbound right-turn overlap phase, and an eastbound right-turn overlap phase. With the improvements proposed at this intersection, the Community Plan reports LOS E results, concluding the impact remains significant and unavoidable. With the additional traffic added by the Proposed Action alternative, the intersection continues to operate at LOS E. Any improvements beyond those recommended in the Community Plan are physically infeasible given the lack of available right-of-way. Therefore, it is recommended the Proposed Action alternative implement the Community Plan improvements, where feasible, and the impact at this intersection will remain significant and unavoidable. Given that the impact at this location remains significant and unavoidable, it is recommended the Proposed Action alternative prepare a TDM plan as outlined in *Section 27.0* of this report and participate in the implementation of TSM measures described in *Section 28.0*. These measures will partially mitigate this significant impact.	No
Alt 2-I-7	13	Rosecrans St/ Lytton St	San Diego	Per the Midway-Pacific Highway Community Plan, improvements are planned at this intersection. The Community Plan proposes right-turn overlap phasing in the northbound, southbound, and westbound directions. A second eastbound left-turn lane is proposed. Implementation of the Community Plan improvements would mitigate the impact to below a level of significance.	Yes

TABLE 12–5
YEAR 2050 WITH ALTERNATIVE 2 SIGNIFICANT IMPACTS AND MITIGATION MEASURES

ID	#	Location	Jur.	Mitigation Measures	Mit.? (Y/N)
Alt 2-I-8	14	Truxtun Rd/ Lytton St/ Barnett Ave	San Diego	There are no planned improvements in the Midway-Pacific Highway Community Plan at this intersection. Constructing an eastbound dedicated right-turn lane within the existing curb-to-curb width would mitigate the impact to below a level of significance.	Yes
Alt 2-I-9	15	Midway Dr/ Enterprise St	San Diego	There are no planned improvements in the Midway-Pacific Highway Community Plan at this intersection. From centerline to centerline, this intersection is approximately 160 feet from the Midway Drive/ Barnett Avenue intersection. The existing configuration of these two intersections are such that raised medians restrict turning movements requiring out of direction travel on Midway Drive, Barnett Avenue and Jessop Lane. The traffic added by the Proposed Action alternative to the westbound right-turning movement is substantial. Those additional trips result in a significant delay for southbound right-turns from Enterprise Street onto Midway Drive. Due to the physical constraints and irregular configuration of this intersection and its proximity to the Midway Drive/ Barnett Avenue intersection, reconstructing this intersection in combination with the Midway/ Barnett Avenue intersection into a signalized four-way intersection would be required to partially mitigate this impact. Given that the impact at this location remains significant and unavoidable, it is recommended the Proposed Action alternative prepare a TDM plan as outlined in *Section 27.0* of this report and participate in the implementation of TSM measures described in *Section 28.0*. These measures will partially mitigate this significant impact.	No
Alt 2-I-10	16	Barnett Ave/ Midway Dr	San Diego	There are no planned improvements in the Midway-Pacific Highway Community Plan at this intersection. From centerline to centerline, this intersection is approximately 160 feet from the Midway Drive/ Enterprise Street intersection. The existing configuration of these two intersections are such that raised medians restrict turning movements requiring out of direction travel on Midway Drive, Barnett Avenue and Jessop Lane. The traffic added by the Proposed Action alternative to the southbound right-turning and eastbound left-turning movements is substantial. Those additional trips result in a significant delay at this intersection. Due to the physical constraints and irregular configuration of this intersection and its proximity to the Midway Drive/ Enterprise Street, reconstructing this intersection in combination with the Midway Drive/ Enterprise Street intersection into a signalized four-way intersection would be required to partially mitigate this impact. Given that the impact at this location remains significant and unavoidable, it is recommended the Proposed Action alternative prepare a TDM plan as outlined in *Section 27.0* of this report and participate in the implementation of TSM measures described in *Section 28.0*. These measures will partially mitigate this significant impact.	No

TABLE 12–5
YEAR 2050 WITH ALTERNATIVE 2 SIGNIFICANT IMPACTS AND MITIGATION MEASURES

ID	#	Location	Jur.	Mitigation Measures	Mit.? (Y/N)
Alt 2-I-11	18	Pacific Hwy/ Kurtz St	San Diego	Per the Midway-Pacific Highway Community Plan, improvements are planned at this intersection to reconfigure the existing geometry. The Community Plan proposes to signalize the intersection and allow eastbound left-turn movements. With the improvements proposed at this intersection, the Community Plan reports high LOS D results. However, the additional traffic added by the Proposed Action alternative would degrade intersection operations to significant levels. Any improvements beyond those recommended in the Community Plan are physically infeasible given the lack of available right-of-way. Therefore, it is recommended the Proposed Action alternative implement the Community Plan improvements, where feasible, and the impact at this intersection will remain significant and unavoidable. Given that the impact at this location remains significant and unavoidable, it is recommended the Proposed Action alternative prepare a TDM plan as outlined in *Section 27.0* of this report and participate in the implementation of TSM measures described in *Section 28.0*. These measures will partially mitigate this significant impact.	No
Alt 2-I-12	19	Sports Arena Blvd/ Pacific Hwy	San Diego	Per the Midway-Pacific Highway Community Plan, improvements are planned at this intersection to reconfigure the existing geometry. The Community Plan proposes to relocate the intersection 500 feet to the north of its current location. Improvements to realign Sports Arena Boulevard to create a right-angle with Pacific Highway are planned, as well as signalizing the intersection, providing an exclusive eastbound left-turn lane from Sports Arena Boulevard onto Pacific Highway and providing a northbound left-turn lane from Pacific Highway onto Sports Arena Boulevard. With the improvements proposed at this intersection, the Community Plan reports LOS C results. With the additional traffic added by the Proposed Action alternative, acceptable LOS operations would continue to occur. Therefore, it is recommended the Proposed Action alternative implement the Community Plan improvements to mitigate the impact to below a level of significance.	Yes
Alt 2-I-13	20	Pacific Hwy/ Enterprise St	San Diego	There are no planned improvements in the Midway-Pacific Highway Community Plan at this intersection. This intersection currently serves as an access point for the existing NAVWAR OTC Site. With future development of the Proposed Action alternative, this intersection would likely be improved to provide additional lanes entering/exiting the site. However, additional lanes would be needed on Pacific Highway. Any widening to Pacific Highway would be infeasible due to lack of right-of-way. Therefore, the impact at this intersection will remain significant and unavoidable. Given that the impact at this location remains significant and unavoidable, it is recommended the Proposed Action alternative prepare a TDM plan as outlined in *Section 27.0* of this report and participate in the implementation of TSM measures described in *Section 28.0*. These measures will partially mitigate this significant impact.	No

TABLE 12–5
YEAR 2050 WITH ALTERNATIVE 2 SIGNIFICANT IMPACTS AND MITIGATION MEASURES

ID	#	Location	Jur.	Mitigation Measures	Mit.? (Y/N)
Alt 2-I-14	22	Old Town Ave/ San Diego Ave	San Diego	There are no planned improvements in the Old Town Community Plan at this intersection. The intersection is built out with regard to available right-of-way. Extra lanes on intersection approaches are needed to improve operations at this intersection. However, given the lack of available right-of-way, widening at this intersection is infeasible. Therefore, no improvements are recommended and the impact at this intersection remains significant and unavoidable. Given that the impact at this location remains significant and unavoidable, it is recommended the Proposed Action alternative prepare a TDM plan as outlined in *Section 27.0* of this report and participate in the implementation of TSM measures described in *Section 28.0*. These measures will partially mitigate this significant impact.	No
Alt 2-I-15	23	Old Town Ave/ Moore St	San Diego	Per the Old Town Community Plan, improvements are recommended at this intersection. The Community Plan recommends signal phasing be changed from permissive to protected and to add exclusive left-turn lanes on Old Town Avenue approaching the intersection. However, the Community Plan concludes there is no available right-of-way to complete the improvements. Together with Caltrans, SANDAG has prepared a concept plan for reconstructing the I-5/Old Town Avenue interchange. As part of this major infrastructure improvement, the existing I-5/Old Town Avenue interchange would be replaced with a new bridge and reconfigured on- and off-ramps. This project would include: a high-occupancy vehicle (HOV) direct access ramp into the future on-site transit center to/from southbound I-5; direct access ramps to the OTC Site to/from I-5, the reconstruction and widening of the I-5/Old Town Avenue interchange; and the realignment and signalization of the Pacific Highway/Barnett Avenue intersection. Additional capacity would be added to the interchange that would improve operations at the Old Town Avenue/ Moore Street intersection that effectively operates as the I-5 North interchange with Old Town Avenue. Construction of the interchange improvements would mitigate the impact to below a level of significance.	Yes
Alt 2-I-16	24	Hancock St/ Old Town Ave/ I-5 SB Off-Ramps	San Diego	There are no planned improvements in the Old Town Community Plan at this intersection. Together with Caltrans, SANDAG has prepared a concept plan for reconstructing the I-5/Old Town Avenue interchange. As part of this major infrastructure improvement, the existing I-5/Old Town Avenue interchange would be replaced with a new bridge and reconfigured on- and off-ramps. This project would include: a high-occupancy vehicle (HOV) direct access ramp into the future on-site transit center to/from southbound I-5; direct access ramps to the OTC Site to/from I-5, the reconstruction and widening of the I-5/Old Town Avenue interchange; and the realignment and signalization of the Pacific Highway/Barnett Avenue intersection. Additional capacity would be added to the interchange that would improve operations at the Old Town Avenue/ Hancock Street intersection that effectively operates as the I-5 southbound off-ramp with Old Town Avenue and Hancock Street. Construction of the interchange improvements would mitigate the impact to below a level of significance.	Yes

TABLE 12–5

YEAR 2050 WITH ALTERNATIVE 2 SIGNIFICANT IMPACTS AND MITIGATION MEASURES

ID	#	Location	Jur.	Mitigation Measures	Mit.? (Y/N)
Alt 2-I-17	25	Witherby St/ Hancock St	San Diego	Per the Midway-Pacific Highway Community Plan, improvements are planned at this intersection to reconfigure the existing geometry. The Community Plan proposes to widen the northbound approach to provide one shared through/right-turn lane and one shared through/left-turn lane. With the improvements proposed at this intersection, the Community Plan reports low LOS D results. However, the additional traffic added by the Proposed Action alternative would degrade intersection operations to significant levels. Together with Caltrans, SANDAG has prepared a concept plan for reconstructing the I-5/Old Town Avenue interchange. As part of this major infrastructure improvement, the existing I-5/Old Town Avenue interchange would be replaced with a new bridge and reconfigured on- and off-ramps. This project would include: a high-occupancy vehicle (HOV) direct access ramp into the future on-site transit center to/from southbound I-5; direct access ramps to the OTC Site to/from I-5, the reconstruction and widening of the I-5/Old Town Avenue interchange; and the realignment and signalization of the Pacific Highway/Barnett Avenue intersection. With the enhanced capacity of the new interchange and direct access to the site, traffic volumes accessing the OTC Site would shift to the new interchange, thus reducing volumes on Pacific Highway, Camino Del Rio W., Hancock Street, Witherby Street and surrounding surface streets. Construction of the interchange improvements would mitigate the impact to below a level of significance.	Yes
Alt 2-I-18	26	Witherby St/ Pacific Hwy	San Diego	Per the Midway-Pacific Highway Community Plan, improvements are planned at this intersection to reconfigure the existing geometry. The Community Plan proposes to remove the grade separation between Witherby Street, Pacific Highway, and Tripoli Avenue and construct an at-grade four-way signalized allowing for full movements. The Community Plan does not further analyze these improvements or discuss their feasibility. Together with Caltrans, SANDAG has prepared a concept plan for reconstructing the I-5/Old Town Avenue interchange. As part of this major infrastructure improvement, the existing I-5/Old Town Avenue interchange would be replaced with a new bridge and reconfigured on- and off-ramps. This project would include: a high-occupancy vehicle (HOV) direct access ramp into the future on-site transit center to/from southbound I-5; direct access ramps to the OTC Site to/from I-5, the reconstruction and widening of the I-5/Old Town Avenue interchange; and the realignment and signalization of the Pacific Highway/Barnett Avenue intersection. With the enhanced capacity of the new interchange and direct access to the site, traffic volumes accessing the OTC Site would shift to the new interchange, thus reducing volumes on Pacific Highway, Camino Del Rio W., Hancock Street, Witherby Street and surrounding surface streets. Construction of the interchange improvements would mitigate the impact to below a level of significance.	Yes

TABLE 12–5
YEAR 2050 WITH ALTERNATIVE 2 SIGNIFICANT IMPACTS AND MITIGATION MEASURES

ID	#	Location	Jur.	Mitigation Measures	Mit.? (Y/N)
Alt 2-I-19	27	Tripoli Ave/ Witherby St	San Diego	Per the Midway-Pacific Highway Community Plan, improvements are planned at this intersection to reconfigure the existing geometry. The Community Plan proposes to remove the grade separation between Witherby Street, Pacific Highway, and Tripoli Avenue and construct an at-grade four-way signalized allowing for full movements. The Community Plan does not further analyze these improvements or discuss their feasibility. Together with Caltrans, SANDAG has prepared a concept plan for reconstructing the I-5/Old Town Avenue interchange. As part of this major infrastructure improvement, the existing I-5/Old Town Avenue interchange would be replaced with a new bridge and reconfigured on- and off-ramps. This project would include: a high-occupancy vehicle (HOV) direct access ramp into the future on-site transit center to/from southbound I-5; direct access ramps to the OTC Site to/from I-5, the reconstruction and widening of the I-5/Old Town Avenue interchange; and the realignment and signalization of the Pacific Highway/Barnett Avenue intersection. With the enhanced capacity of the new interchange and direct access to the site, traffic volumes accessing the OTC Site would shift to the new interchange, thus reducing volumes on Pacific Highway, Camino Del Rio W., Hancock Street, Witherby Street and surrounding surface streets. Construction of the interchange improvements would mitigate the impact to below a level of significance.	Yes
Alt 2-I-20	28	Noell St/ Hancock St	San Diego	There are no planned improvements in the Midway-Pacific Highway Community Plan at this intersection. Installing a traffic signal at this intersection would mitigate the impact to below a level of significance.	Yes
Alt 2-I-21	30	Washington St/ Hancock St	San Diego	Per the Midway-Pacific Highway Community Plan, improvements are recommended at this intersection. The Community Plan recommends restriping the southbound approach to provide a second right-turn lane. However, the Community Plan states that the provision of the additional turn lane would eliminate heavily utilized street parking and concluded impacts to this intersection would remain significant and unavoidable. Together with Caltrans, SANDAG has prepared a concept plan for reconstructing the I-5/Old Town Avenue interchange. As part of this major infrastructure improvement, the existing I-5/Old Town Avenue interchange would be replaced with a new bridge and reconfigured on- and off-ramps. This project would include: a high-occupancy vehicle (HOV) direct access ramp into the future on-site transit center to/from southbound I-5; direct access ramps to the OTC Site to/from I-5, the reconstruction and widening of the I-5/Old Town Avenue interchange; and the realignment and signalization of the Pacific Highway/Barnett Avenue intersection. With the enhanced capacity of the new interchange and direct access to the site, traffic volumes accessing the OTC Site would shift to the new interchange, thus reducing volumes on Pacific Highway, Camino Del Rio W., Hancock Street, Witherby Street and surrounding surface streets. Construction of the interchange improvements would mitigate the impact to below a level of significance.	Yes

TABLE 12–5
YEAR 2050 WITH ALTERNATIVE 2 SIGNIFICANT IMPACTS AND MITIGATION MEASURES

ID	#	Location	Jur.	Mitigation Measures	Mit.? (Y/N)
Alt 2-I-22	33	Pacific Hwy/ Sassafras St	San Diego	Per the Airport Development Plan, improvements are recommended at this intersection. The Airport Development Plan recommends the addition of a second eastbound through lane and restriping the southbound approach to provide a left-turn lane, three through lanes, and a right-turn lane to add capacity to the intersection, though the additional capacity continued to result in LOS E operations rendering the impact not fully mitigated. In addition, it recommends a Class IV Cycle Track be striped on Pacific Highway. The additional traffic added by the Proposed Action alternative would degrade intersection operations to significant levels. Any improvements beyond those recommended in the Airport Development Plan are physically infeasible given the lack of available right-of-way. Therefore, it is recommended the Proposed Action alternative implement the Airport Development Plan improvements, where feasible, and the impact at this intersection will remain significant and unavoidable. Given that the impact at this location remains significant and unavoidable, it is recommended the Proposed Action alternative prepare a TDM plan as outlined in *Section 27.0* of this report and participate in the implementation of TSM measures described in *Section 28.0*. These measures will partially mitigate this significant impact.	No
Alt 2-I-23	34	Pacific Hwy / Laurel St	San Diego	Per the Airport Development Plan, improvements are recommended at this intersection. The Airport Development Plan recommends the removal of a westbound through land and addition of a second eastbound left-turn lane, conversion of a southbound through lane into a second right-turn lane, and re-coordination of the signals along Laurel Street. In addition, it recommends a Class IV Cycle Track be striped on Pacific Highway. Implementation of these improvements in the Airport Development Plan showed the intersection would continue to operate at poor LOS conditions rendering the impact not fully mitigated. The additional traffic added by the Proposed Action alternative would degrade intersection operations to significant levels. Any improvements beyond those recommended in the Airport Development Plan are physically infeasible given the lack of available right-of-way. Therefore, it is recommended the Proposed Action alternative implement the Airport Development Plan improvements, where feasible, and the impact at this intersection will remain significant and unavoidable. Given that the impact at this location remains significant and unavoidable, it is recommended the Proposed Action alternative prepare a TDM plan as outlined in *Section 27.0* of this report and participate in the implementation of TSM measures described in *Section 28.0*. These measures will partially mitigate this significant impact.	No

TABLE 12–5
YEAR 2050 WITH ALTERNATIVE 2 SIGNIFICANT IMPACTS AND MITIGATION MEASURES

ID	#	Location	Jur.	Mitigation Measures	Mit.? (Y/N)
Alt 2-I-24	35	Harbor Dr / Laurel St	San Diego	Per the Airport Development Plan, improvements are recommended at this intersection. The Airport Development Plan recommends the addition of a third eastbound left-turn lane and removal of an eastbound through lane to add capacity to the intersection, though the additional capacity continued to result in poor LOS operations rendering the impact not fully mitigated. The additional traffic added by the Proposed Action alternative would degrade intersection operations to significant levels. Any improvements beyond those recommended in the Airport Development Plan are physically infeasible given the lack of available right-of-way. Therefore, it is recommended the Proposed Action alternative implement the Airport Development Plan improvements, where feasible, and the impact at this intersection will remain significant and unavoidable. Given that the impact at this location remains significant and unavoidable, it is recommended the Proposed Action alternative prepare a TDM plan as outlined in *Section 27.0* of this report and participate in the implementation of TSM measures described in *Section 28.0*. These measures will partially mitigate this significant impact.	No
Alt 2-I-25	36	Pacific Hwy / Sea World Dr	San Diego	There are no planned improvements in the Mission Bay Park Master Plan at this intersection. In order to improve operations at this intersection, the Proposed Action alternative should construct an additional southbound left-turn lane from SeaWorld Drive to eastbound Pacific Highway. Implementation of this improvement would mitigate the impact to below a level of significance.	Yes
STREET SEGMENTS					
		Rosecrans Street			
Alt 2-S-1	1	Dewey Rd to Lytton St	San Diego	Per the Peninsula Community Plan, improvements are planned along this street segment to reconfigure the existing geometry. This segment of Rosecrans Street currently functions as a five-lane Collector with a center left-turn lane with a LOS E capacity of 37,500 ADT. The Community Plan classifies this segment of the roadway as a four-lane Major Arterial with a LOS E capacity of 40,000 ADT. This results in an additional 2,500 ADT of capacity over existing conditions. Implementation of the Community Plan improvements would mitigate the impact to below a level of significance.	Yes
Alt 2-S-2	2	Lytton St to Midway Dr	San Diego	Per the Midway-Pacific Highway Community Plan, improvements are planned along this street segment to reconfigure the existing geometry. This segment of Rosecrans Street currently functions as a six-lane Major Arterial with a LOS E capacity of 50,000 ADT. The Community Plan classifies this segment of the roadway as a six-lane Prime Arterial with a LOS E capacity of 60,000 ADT. This results in an additional 10,000 ADT of capacity over existing conditions. Implementation of the Community Plan improvements would mitigate the impact to below a level of significance.	Yes

TABLE 12–5

YEAR 2050 WITH ALTERNATIVE 2 SIGNIFICANT IMPACTS AND MITIGATION MEASURES

ID	#	Location	Jur.	Mitigation Measures	Mit.? (Y/N)
Alt 2-S-3	3	Midway Dr to Sports Arena Blvd	San Diego	Per the Midway-Pacific Highway Community Plan, improvements are planned along this street segment to reconfigure the existing geometry. This segment of Rosecrans Street currently functions as a six-lane Major Arterial with a LOS E capacity of 50,000 ADT. The Community Plan classifies this segment of the roadway as a six-lane Prime Arterial with a LOS E capacity of 60,000 ADT. This results in an additional 10,000 ADT of capacity over existing conditions. Implementation of the Community Plan improvements would mitigate the impact to below a level of significance.	Yes
Alt 2-S-4	4	Sports Arena Blvd to Kurtz St	San Diego	Per the Midway-Pacific Highway Community Plan, improvements are planned along this street segment to reconfigure the existing geometry. This segment of Rosecrans Street currently functions as a four-lane Collector with a center left-turn lane with a LOS E capacity of 30,000 ADT. The Community Plan classifies this segment of the roadway as a four-lane Major Arterial with a LOS E capacity of 40,000 ADT. This results in an additional 10,000 ADT of capacity over existing conditions. Implementation of the Community Plan improvements would mitigate the impact to below a level of significance.	Yes
Alt 2-S-5	5	E: Kurtz St to Pacific Hwy	San Diego	Per the Midway-Pacific Highway Community Plan, improvements are planned along this street segment to reconfigure the existing geometry. This segment of Rosecrans Street currently functions as a four-lane Collector with a center left-turn lane with a LOS E capacity of 30,000 ADT. The Community Plan classifies this segment of the roadway as a s four-lane Major Arterial with a LOS E capacity of 40,000 ADT. This results in an additional 10,000 ADT of capacity over existing conditions. Implementation of the Community Plan improvements would mitigate the impact to below a level of significance.	Yes
		Taylor Street			
Alt 2-S-6	9	Presidio Dr to I-8 East Ramp	San Diego	There are no planned improvements in the Old Town Community Plan along this street segment. Additional lanes are needed on Taylor Street to increase the capacity along this roadway. However, due to the historic nature of the Old Town Community, the Community Plan does not propose any road widenings or significant capacity improvements. Additionally, there is not enough right-of-way available along this segment of Taylor Street to accommodate two additional through lanes and a center median while maintaining a Class II bicycle facility. Therefore, the impact would remain significant and unavoidable. Given that the impact at this location remains significant and unavoidable, it is recommended the Proposed Action alternative prepare a TDM plan as outlined in *Section 27.0* of this report and participate in the implementation of TSM measures described in *Section 28.0*. These measures will partially mitigate this significant impact.	No

TABLE 12–5
YEAR 2050 WITH ALTERNATIVE 2 SIGNIFICANT IMPACTS AND MITIGATION MEASURES

ID	#	Location	Jur.	Mitigation Measures	Mit.? (Y/N)
		Pacific Highway			
Alt 2-S-7	11	SeaWorld Dr to Taylor St	San Diego	There are no planned improvements in the Midway-Pacific Highway Community Plan along this street segment. Additional lanes are needed on Pacific Highway to increase the capacity along this roadway. Due to the lack of available right-of-way and this roadway serving as a bridge over the environmentally sensitive San Diego River, widening the bridge would be infeasible. Together with Caltrans, SANDAG has prepared a concept plan for reconstructing the I-5/Old Town Avenue interchange. As part of this major infrastructure improvement, the existing I-5/Old Town Avenue interchange would be replaced with a new bridge and reconfigured on- and off-ramps. This project would include: a high-occupancy vehicle (HOV) direct access ramp into the future on-site transit center to/from southbound I-5; direct access ramps to the OTC Site to/from I-5, the reconstruction and widening of the I-5/Old Town Avenue interchange; and the realignment and signalization of the Pacific Highway/Barnett Avenue intersection. With the enhanced capacity of the new interchange and direct access to the site, traffic volumes accessing the OTC Site would shift to the new interchange, thus reducing volumes on Pacific Highway, Camino Del Rio W., Hancock Street, Witherby Street and surrounding surface streets. Construction of the interchange improvements would mitigate the impact to below a level of significance.	Yes

TABLE 12–5
YEAR 2050 WITH ALTERNATIVE 2 SIGNIFICANT IMPACTS AND MITIGATION MEASURES

ID	#	Location	Jur.	Mitigation Measures	Mit.? (Y/N)
Alt 2-S-8	13	Kurtz St to Sports Arena Blvd	San Diego	There are no planned improvements in the Midway-Pacific Highway Community Plan along this street segment. Additional lanes are needed on Pacific Highway to increase the capacity along this roadway. Widening Pacific Highway would be in conflict with the Community Plan. Therefore, the impact would remain significant and unavoidable. Together with Caltrans, SANDAG has prepared a concept plan for reconstructing the I-5/Old Town Avenue interchange. As part of this major infrastructure improvement, the existing I-5/Old Town Avenue interchange would be replaced with a new bridge and reconfigured on- and off-ramps. This project would include: direct access ramps to the OTC Site to/from I-5, the reconstruction and widening of the I-5/Old Town Avenue interchange; and the realignment and signalization of the Pacific Highway/Barnett Avenue intersection. With the enhanced capacity of the new interchange and direct access to the site, traffic volumes accessing the OTC Site would shift to the new interchange, thus reducing volumes on Pacific Highway, Camino Del Rio W., Hancock Street, Witherby Street and surrounding surface streets. Although the interchange project improves operations along Pacific Highway, the daily volumes on this segment of Pacific Highway would continue to exceed the capacity of the roadway. Therefore, the impact would remain significant and unavoidable. Given that the impact at this location remains significant and unavoidable, it is recommended the Proposed Action alternative prepare a TDM plan as outlined in *Section 27.0* of this report and participate in the implementation of TSM measures described in *Section 28.0*. These measures will partially mitigate this significant impact.	No

With the enhanced capacity of the new interchange and direct access to the site, traffic volumes accessing the OTC Site would shift to the new interchange, thus reducing volumes on Pacific Highway, Camino Del Rio W., Hancock Street, Witherby Street and surrounding surface streets. Construction of the interchange improvements would mitigate the impact to below a level of significance.	Yes
Alt 2-S-12	17	W. Washington St to Sassafras St	San Diego	There are no planned improvements in the Midway-Pacific Highway Community Plan along this street segment. Additional lanes are needed on Pacific Highway to increase the capacity along this roadway. Widening Pacific Highway would be in conflict with the Community Plan. Therefore, the impact would remain significant and unavoidable. Given that the impact at this location remains significant and unavoidable, it is recommended the Proposed Action alternative prepare a TDM plan as outlined in *Section 27.0* of this report and participate in the implementation of TSM measures described in *Section 28.0*. These measures will partially mitigate this significant impact.	No
		Morena Boulevard			
Alt 2-S-13	19	Friars Rd to I-8	San Diego	There are no planned improvements in the Midway-Pacific Highway Community Plan along this street segment. Additional lanes are needed on Morena Boulevard to increase the capacity along this roadway. Due to the lack of available right-of-way and this roadway serving as a bridge over the environmentally sensitive San Diego River, widening the bridge to four lanes would be infeasible. Therefore, the impact would remain significant and unavoidable. Given that the impact at this location remains significant and unavoidable, it is recommended the Proposed Action alternative prepare a TDM plan as outlined in *Section 27.0* of this report and participate in the implementation of TSM measures described in *Section 28.0*. These measures will partially mitigate this significant impact.	No
		Linda Vista Road			

TABLE 12–5
YEAR 2050 WITH ALTERNATIVE 2 SIGNIFICANT IMPACTS AND MITIGATION MEASURES

ID	#	Location	Jur.	Mitigation Measures	Mit.? (Y/N)
Alt 2-S-14	20	Morena Blvd to Colusa St	San Diego	Per the Linda Vista Community Plan, improvements are planned along this street segment to reconfigure the existing geometry. This segment of Linda Vista Road currently functions as a four-lane Collector with a LOS E capacity of 30,000 ADT. The Community Plan classifies this segment of the roadway as a four-lane Major Road with a raised median with a LOS E capacity of 40,000 ADT. This results in an additional 10,000 ADT of capacity over existing conditions. Implementation of the Community Plan improvements would mitigate the impact to below a level of significance.	Yes
		Kurtz Street			
Alt 2-S-15	21	Rosecrans to Pacific Hwy	San Diego	Per the Midway-Pacific Highway Community Plan, improvements are planned along this street segment to reconfigure the existing geometry. This segment of Kurtz Street currently functions as a two-lane Collector with a LOS E capacity of 8,000 ADT. The Community Plan classifies this segment of the roadway as a two-lane Collector with a center left-turn lane with a LOS E capacity of 15,000 ADT. This results in an additional 7,000 ADT of capacity over existing conditions. Implementation of the Community Plan improvements would mitigate the impact to below a level of significance.	Yes
		Sports Arena Blvd			
Alt 2-S-16	25	Rosecrans St to Enterprise St	San Diego	Per the Midway-Pacific Highway Community Plan, improvements are planned along this street segment to reconfigure the existing geometry. This segment of Sports Arena Boulevard currently functions as a two-lane Collector with a LOS E capacity of 8,000 ADT. The Community Plan classifies this segment of the roadway as a two-lane Collector with a center left-turn lane with a LOS E capacity of 15,000 ADT. This results in an additional 7,000 ADT of capacity over existing conditions. Implementation of the Community Plan improvements would mitigate the impact to below a level of significance.	Yes
		Midway Drive			
Alt 2-S-17	26	East Dr to Rosecrans St	San Diego	There are no planned improvements in the Midway-Pacific Highway Community Plan along this street segment. Additional capacity is needed on Midway Drive to improve operations along this roadway. This segment of Midway Drive currently functions as a four-lane Collector with a center left-turn lane with a LOS E capacity of 30,000 ADT. Due to the lack of available right-of-way, widening the roadway to four-lane Major Arterial standards would be infeasible. Therefore, the impact would remain significant and unavoidable. Given that the impact at this location remains significant and unavoidable, it is recommended the Proposed Action alternative prepare a TDM plan as outlined in *Section 27.0* of this report and participate in the implementation of TSM measures described in *Section 28.0*. These measures will partially mitigate this significant impact.	No

TABLE 12–5

YEAR 2050 WITH ALTERNATIVE 2 SIGNIFICANT IMPACTS AND MITIGATION MEASURES

ID	#	Location	Jur.	Mitigation Measures	Mit.? (Y/N)
Alt 2-S-18	27	Rosecrans St to Bogley Dr	San Diego	Per the Midway-Pacific Highway Community Plan, improvements are planned along this street segment to reconfigure the existing geometry. This segment of Midway Drive currently functions as a four-lane Collector with a center left-turn lane with a LOS E capacity of 30,000 ADT. The Community Plan classifies this segment of the roadway as a four-lane Major Arterial with a LOS E capacity of 40,000 ADT. This results in an additional 10,000 ADT of capacity over existing conditions. Implementation of the Community Plan improvements would mitigate the impact to below a level of significance.	Yes
Alt 2-S-19	28	Bogley Dr to Barnett Ave	San Diego	Per the Midway-Pacific Highway Community Plan, improvements are planned along this street segment to reconfigure the existing geometry. This segment of Midway Drive currently functions as a four-lane Collector with a center left-turn lane with a LOS E capacity of 30,000 ADT. The Community Plan classifies this segment of the roadway as a four-lane Major Arterial with a LOS E capacity of 40,000 ADT. This results in an additional 10,000 ADT of capacity over existing conditions. With the improvements proposed along this street segment, the Community Plan reports LOS C results. However, the additional traffic added by the Proposed Action alternative degrades roadway operations to significant levels. Any improvements beyond those recommended in the Community Plan are physically infeasible given the lack of available right-of-way. Therefore, it is recommended the Proposed Action alternative implement the Community Plan improvements, where feasible, and the impact on this street segment will remain significant and unavoidable. Given that the impact at this location remains significant and unavoidable, it is recommended the Proposed Action alternative prepare a TDM plan as outlined in *Section 27.0* of this report and participate in the implementation of TSM measures described in *Section 28.0*. These measures will partially mitigate this significant impact.	No
		Lytton Street			
Alt 2-S-20	29	Rosecrans St to St. Charles St	San Diego	Per the Midway-Pacific Highway Community Plan, improvements are planned along this street segment to reconfigure the existing geometry. This segment of Lytton Street currently functions as a four-lane Collector with a center left-turn lane with a LOS E capacity of 30,000 ADT. The Community Plan classifies this segment of the roadway as a four-lane Major Arterial with an LOS E capacity of 40,000 ADT. This results in an additional 10,000 ADT of capacity over existing conditions. Implementation of the Community Plan improvements would mitigate the impact to below a level of significance.	Yes

TABLE 12–5
YEAR 2050 WITH ALTERNATIVE 2 SIGNIFICANT IMPACTS AND MITIGATION MEASURES

ID	#	Location	Jur.	Mitigation Measures	Mit.? (Y/N)
		Barnett Avenue			
Alt 2-S-21	30	St. Charles St to Henderson Ave	San Diego	Per the Midway-Pacific Highway Community Plan, improvements are planned along this street segment to reconfigure the existing geometry. This segment of Barnett Avenue currently functions as a four-lane Collector with a raised median with a LOS E capacity of 30,000 ADT. The Community Plan classifies this segment of the roadway as a four-lane Major Arterial with a LOS E capacity of 40,000 ADT. This results in an additional 10,000 ADT of capacity over existing conditions. Implementation of the Community Plan improvements would mitigate the impact to below a level of significance.	Yes
Alt 2-S-22	31	Henderson Ave to Pacific Hwy	San Diego	Per the Midway-Pacific Highway Community Plan, improvements are planned along this street segment to reconfigure the existing geometry. This segment of Barnett Avenue currently functions as a four-lane Collector with a center left-turn lane with a LOS E capacity of 30,000 ADT. The Community Plan classifies this segment of the roadway as a six-lane Prime Arterial with a LOS E capacity of 60,000 ADT. This results in an additional 30,000 ADT of capacity over existing conditions. Implementation of the Community Plan improvements would mitigate the impact to below a level of significance.	Yes
		Hancock Street			
Alt 2-S-23	32	Old Town Ave to Witherby St	San Diego	Per the Midway-Pacific Highway Community Plan, improvements are planned along this street segment to reconfigure the existing geometry. This segment of Hancock Street currently functions as a two-lane Collector with a LOS E capacity of 8,000 ADT. The Community Plan classifies this segment of the roadway as a four-lane Collector with a LOS E capacity of 15,000 ADT. This results in an additional 7,000 ADT of capacity over existing conditions. With the improvements proposed along this street segment, the Community Plan reports mid-LOS D results. However, the additional traffic added by the Proposed Action alternative degrades roadway operations to significant levels. Together with Caltrans, SANDAG has prepared a concept plan for reconstructing the I-5/Old Town Avenue interchange. As part of this major infrastructure improvement, the existing I-5/Old Town Avenue interchange would be replaced with a new bridge and reconfigured on- and off-ramps. This project would include: a high-occupancy vehicle (HOV) direct access ramp into the future on-site transit center to/from southbound I-5; direct access ramps to the OTC Site to/from I-5, the reconstruction and widening of the I-5/Old Town Avenue interchange; and the realignment and signalization of the Pacific Highway/Barnett Avenue intersection. With the enhanced capacity of the new interchange and direct access to the site, traffic volumes accessing the OTC Site would shift to the new interchange, thus reducing volumes on Pacific Highway, Camino Del Rio W., Hancock Street, Witherby Street and surrounding surface streets. Construction of the interchange improvements would mitigate the impact to below a level of significance.	Yes

TABLE 12–5

YEAR 2050 WITH ALTERNATIVE 2 SIGNIFICANT IMPACTS AND MITIGATION MEASURES

ID	#	Location	Jur.	Mitigation Measures	Mit.? (Y/N)
Alt 2-S-24	33	Witherby St to Noell St	San Diego	There are no planned improvements in the Midway-Pacific Highway Community Plan along this street segment. Together with Caltrans, SANDAG has prepared a concept plan for reconstructing the I-5/Old Town Avenue interchange. As part of this major infrastructure improvement, the existing I-5/Old Town Avenue interchange would be replaced with a new bridge and reconfigured on- and off-ramps. This project would include: a high-occupancy vehicle (HOV) direct access ramp into the future on-site transit center to/from southbound I-5; direct access ramps to the OTC Site to/from I-5, the reconstruction and widening of the I-5/Old Town Avenue interchange; and the realignment and signalization of the Pacific Highway/Barnett Avenue intersection. With the enhanced capacity of the new interchange and direct access to the site, traffic volumes accessing the OTC Site would shift to the new interchange, thus reducing volumes on Pacific Highway, Camino Del Rio W., Hancock Street, Witherby Street and surrounding surface streets. Construction of the interchange improvements would mitigate the impact to below a level of significance.	Yes
		W. Washington Street			
Alt 2-S-25	37	Hancock St to W. University Ave	San Diego	There are no planned improvements in the Uptown Community Plan along this street segment. Additional lanes are needed on Washington Street to increase the capacity along this roadway. Widening this section of Washington Street requires substantial grading and filling on both sides of the roadway. On the south side, a steep grade abuts the shoulder. On the north side, a drainage ditch lies adjacent to the roadway. The physical constraints of widening this segment of Washington Street would render this impact significant and unavoidable. Given that the impact at this location remains significant and unavoidable, it is recommended the Proposed Action alternative prepare a TDM plan as outlined in *Section 27.0* of this report and participate in the implementation of TSM measures described in *Section 28.0*. These measures will partially mitigate this significant impact.	No
FREEWAYS					
Alt 2-F-1	2	I-5: I-8 to Old Town Ave	Caltrans	The SANDAG 2050 San Diego Forward: The Regional Plan identifies "operational improvements" along this freeway segment. The improvements are anticipated to be completed by the Year 2050, however, there is uncertainty to the actual improvements and sources of funding. Therefore, the impact on this freeway segment will remain significant and unavoidable. Given that the impact at this location remains significant and unavoidable, it is recommended the Proposed Action alternative prepare a TDM plan as outlined in *Section 27.0* of this report to reduce overall vehicular traffic. These measures will partially mitigate this significant impact.

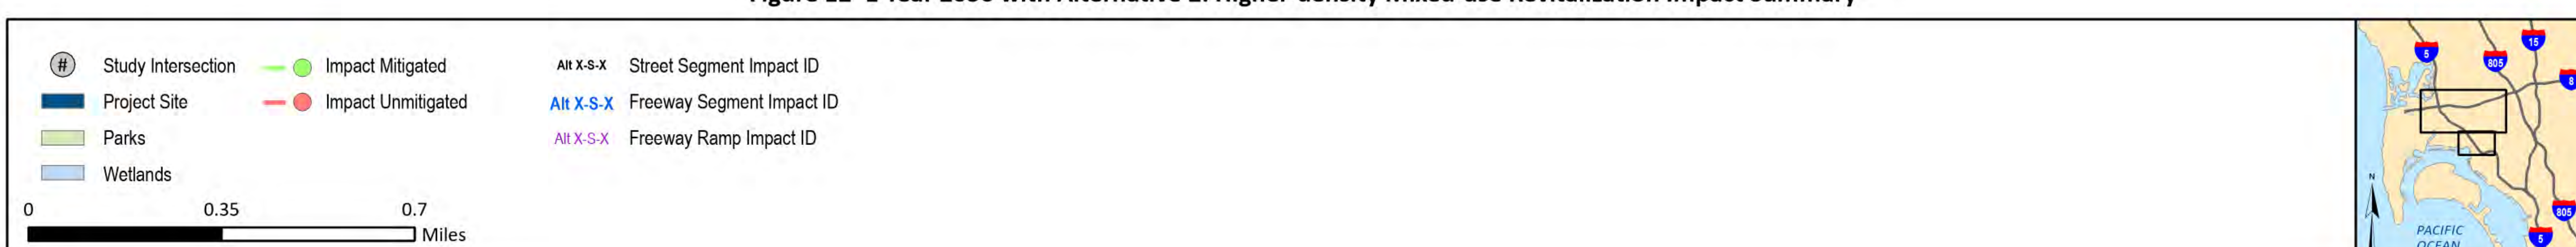
Figure 12–1 Year 2050 with Alternative 2: Higher-density Mixed-use Revitalization Impact Summary



13.0 YEAR 2050 WITH ALTERNATIVE 3: LOWER-DENSITY MIXED-USE REVITALIZATION ANALYSIS

The following section presents the analysis of study area intersections, street segments, freeway segments, and ramp meters under Year 2050 conditions with the addition of Alternative 3: Lower-density Mixed-Use Revitalization traffic. No changes to the street network over existing conditions were assumed in the analysis. For the purposes of this study, impacts identified under Year 2050 conditions are considered "cumulative" transportation impacts.

13.1 Peak Hour Intersection Operations

Intersection capacity analyses were conducted for the study intersections under Year 2050 with Alternative 3: Lower-density Mixed-use Revitalization conditions. ***Table 13–1*** reports the intersection operations during peak hour conditions. The following intersections are calculated to operate at LOS E or F with the addition of the Proposed Action alternative:

- **Intersection #6 Rosecrans Street & Taylor Street / Pacific Highway – LOS F during the a.m. and p.m. peak hours**
- **Intersection #7. Rosecrans Street / Jefferson Street – LOS E/F during the a.m./p.m. peak hours**
- **Intersection #8. Camino Del Rio W. / Hancock Street – LOS E/F during the a.m./p.m. peak hours**
- **Intersection #11. Rosecrans Street / Sports Arena Boulevard – LOS F during the p.m. peak hour**
- **Intersection #12. Rosecrans Street / Midway Drive – LOS E during the p.m. peak hour**
- **Intersection #13. Rosecrans Street / Lytton Street – LOS E during the a.m. and p.m. peak hours**
- **Intersection #14. Lytton Street & Barnett Avenue / Truxtun Road – LOS E/F during the a.m./p.m. peak hours**
- **Intersection #15. Midway Drive / Enterprise Street – LOS E/F during the a.m./p.m. peak hours**
- **Intersection #18. Pacific Highway / Kurtz Street – LOS F during the a.m. and p.m. peak hours**
- **Intersection #19. Pacific Highway / Sports Arena Boulevard – LOS E/F during the a.m./p.m. peak hours**
- **Intersection #20. Pacific Highway / Enterprise Street – LOS F during the a.m. and p.m. peak hours**
- **Intersection #22. Old Town Avenue / San Diego Avenue – LOS F/E during the a.m./p.m. peak hours**
- **Intersection #23. Old Town Avenue / Moore Street – LOS F during the a.m. and p.m. peak hours**

- **<u>Intersection #24. Old Town Avenue / Hancock Street – LOS F during the a.m. and p.m. peak hours</u>**
- **<u>Intersection #25. Witherby Street / Hancock Street – LOS F during the a.m. and p.m. peak hours</u>**
- **<u>Intersection #26. Witherby Street / Pacific Highway – LOS F during the a.m. and p.m. peak hours</u>**
- **<u>Intersection #27. Witherby Street / Tripoli Avenue – LOS F during the p.m. peak hour</u>**
- **<u>Intersection #28. Hancock Street / Noell Street – LOS E/F during the a.m./p.m. peak hour</u>**
- **<u>Intersection #30. W. Washington Street / Hancock Street – LOS E during the p.m. peak hour</u>**
- Intersection #31. W. Washington Street / Pacific Highway (N) – LOS F during the p.m. peak hour
- **<u>Intersection #33. Pacific Highway / Sassafras Street – LOS F during the a.m. and p.m. peak hours</u>**
- **<u>Intersection #34. Pacific Highway / Laurel Street – LOS F during the a.m. and p.m. peak hours</u>**
- **<u>Intersection #35. Harbor Drive / Laurel Street – LOS F during the a.m. and p.m. peak hours</u>**
- **<u>Intersection #36. Pacific Highway / Sea World Drive – LOS E/F during the a.m./p.m. peak hours</u>**
- Intersection #38. Sea World Drive / I-5 NB Ramps – LOS F during the p.m. peak hour

Based on the established significance criteria, **<u>23 significant cumulative impacts</u>** were calculated with the addition of Alternative 3 traffic at the intersections **<u>bolded and underlined</u>** above since the Proposed Action alternative-induced change in delay is greater than 2.0 seconds for LOS E operating intersections and greater than 1.0 second for LOS F operating intersections.

Appendix N contains the intersection analysis worksheets for the Year 2050 with Alternative 3: Lower-density Mixed-use Revitalization scenario.

13.2 Daily Street Segment Operations

Street segment analyses were conducted for roadways in the study area under Year 2050 with Alternative 3: Lower-density Mixed-use Revitalization conditions. ***Table 13–2*** reports the Year 2050 with Alternative 3: Lower-density Mixed-use Revitalization daily street segment operations. The following segments are calculated to operate at LOS E or F with the addition of the Proposed Action alternative:

- **<u>Street Segment #1. Rosecrans Street: Dewey Road to Lytton Street (LOS F)</u>**
- **<u>Street Segment #2. Rosecrans Street: Lytton Street to Midway Drive (LOS F)</u>**

- **<u>Street Segment #3. Rosecrans Street: Midway Drive to Sports Arena Boulevard (LOS F)</u>**
- **<u>Street Segment #4. Rosecrans Street: Sports Arena Boulevard to Kurtz Street (LOS F)</u>**
- **<u>Street Segment #5. Rosecrans Street: Kurtz Street to Pacific Highway (LOS E)</u>**
- **<u>Street Segment #9. Taylor Street: Presidio Drive to I-8 East Ramp (LOS F)</u>**
- **<u>Street Segment #11. Pacific Highway: SeaWorld Drive to Taylor Street (LOS F)</u>**
- **<u>Street Segment #13. Pacific Highway: Kurtz Street to Sports Arena Boulevard (LOS F)</u>**
- **<u>Street Segment #14. Pacific Highway: Sports Arena Boulevard to Barnett Avenue (LOS F)</u>**
- **<u>Street Segment #15. Pacific Highway: Barnett Avenue to Witherby Street (LOS F)</u>**
- **<u>Street Segment #16. Pacific Highway: Witherby Street to W. Washington Street (LOS F)</u>**
- **<u>Street Segment #17. Pacific Highway: W. Washington Street to Sassafras Street (LOS F)</u>**
- **<u>Street Segment #19. Morena Boulevard: Friars Road to I-8 (LOS F)</u>**
- **<u>Street Segment #20. Linda Vista Road: Morena Boulevard to Colusa Street (LOS F)</u>**
- **<u>Street Segment #21. Kurtz Street: Rosecrans Street to Pacific Highway (LOS F)</u>**
- **<u>Street Segment #25. Sports Arena Boulevard: Rosecrans Street to Enterprise Street (LOS E)</u>**
- **<u>Street Segment #26. Midway Drive: East Drive to Rosecrans Street (LOS F)</u>**
- **<u>Street Segment #27. Midway Drive: Rosecrans Street to Bogley Drive (LOS F)</u>**
- **<u>Street Segment #28. Midway Drive: Bogley Drive to Barnett Avenue (LOS F)</u>**
- **<u>Street Segment #29. Lytton Street: Rosecrans Street to St. Charles Street (LOS F)</u>**
- **<u>Street Segment #30. Barnett Avenue: St. Charles Street to Henderson Avenue (LOS F)</u>**
- **<u>Street Segment #31. Barnett Avenue: Henderson Avenue to Pacific Highway (LOS F)</u>**
- **<u>Street Segment #32. Hancock Street: Old Town Avenue to Witherby Street (LOS F)</u>**
- **<u>Street Segment #33. Hancock Street: Witherby Street Noell Street (LOS E)</u>**
- Street Segment #34. Hancock Street: Noell Street to W. Washington Street (LOS F)
- Street Segment #35. W. Washington Street: Admiral Boland Way to Pacific Highway (LOS F)
- **<u>Street Segment #37. W. Washington Street: Hancock Street to W. University Avenue (LOS E)</u>**

Based on the established significance criteria, **<u>25 significant cumulative impact</u>** were calculated with the addition of Alternative 3 traffic on study area street segments **<u>bolded and underlined</u>** above since the Proposed Action alternative-induced change in V/C is greater than 0.02 for LOS E operating street segments and greater than 0.01 for LOS F operating street segments.

13.3 Peak Hour Freeway Segment Operations

Freeway segments were analyzed under Year 2050 with Alternative 3: Lower-density Mixed-use Revitalization conditions. ***Tables 13–3*** and ***13–4*** report the Year 2050 with Alternative 3: Lower-Density Mixed-Use freeway segment operations during the a.m. and p.m. peak hours, respectively. The following freeway segments are calculated to operate at LOS E or F with the addition of the Proposed Action alternative:

- <u>**Freeway Segment #2. I-5: I-8 to Old Town Avenue, SB (LOS E – a.m. peak) and NB/SB (LOS E – p.m. peak)**</u>
- <u>**Freeway Segment #6. I-5: Pacific Highway Viaduct to Laurel Street, NB/SB (LOS E/F – a.m. peak) and NB/SB (LOS E/F – p.m. peak)**</u>
- <u>**Freeway Segment #7. I-5: Laurel Street to Hawthorn Street, NB/SB (LOS E/F – a.m. peak) and NB/SB (LOS F – p.m. peak)**</u>
- <u>**Freeway Segment #8. I-5: Hawthorn Street to 1st Avenue, NB/SB (LOS E/F – a.m. peak) and NB/SB (LOS F – p.m. peak)**</u>
- <u>**Freeway Segment #9. I-5: 1st Avenue to 6th Avenue, NB/SB (LOS F – a.m. peak) and NB/SB (LOS F – p.m. peak)**</u>
- <u>**Freeway Segment #10. I-5: 6th Avenue to SR-163, NB/SB (LOS E/F – a.m. peak) and NB/SB (LOS E/F – p.m. peak)**</u>
- <u>**Freeway Segment #12. I-8: I-5 to Morena Boulevard, WB (LOS E – a.m. peak)**</u>
- <u>**Freeway Segment #13. I-8: Morena Boulevard to Hotel Circle/Taylor Street, WB (LOS F – a.m. peak) and EB (LOS E – p.m. peak)**</u>
- <u>**Freeway Segment #14. I-8: Taylor Street to Hotel Circle, WB (LOS E – a.m. peak) and EB (LOS F – p.m. peak)**</u>
- <u>**Freeway Segment #15. I-8: Hotel Circle to SR-163, WB (LOS E – a.m. peak) and EB (LOS F – p.m. peak)**</u>

Based on the established significance criteria, <u>**ten significant cumulative impacts**</u> were calculated with the addition of Alternative 3 traffic on study area freeway segments <u>**bolded and underlined**</u> above since the Proposed Action alternative-induced change in V/C is greater than 0.01 for LOS E operating freeway segments and greater than 0.005 for LOS F operating freeway segments

Appendix O contains the detailed HCS calculations sheets for the Year 2050 with Alternative 3: Lower-density Mixed-use Revitalization scenario.

13.4 Peak Hour Ramp Meter Operations

The Moore Street / NB I-5 on-ramp meter was analyzed under Year 2050 with Alternative 3: Lower-density Mixed-use Revitalization conditions. ***Table 13–5*** reports the Year 2050 with Alternative 3: Lower-density Mixed-use Revitalization ramp meter operations.

- **Ramp Meter #1. Moore Street/ I-5 NB On-ramp** – Delays of 54/64 minutes and queues of 304/337 vehicles during the a.m. / p.m. peak hours are calculated at the *Moore Street / NB I-5 On-Ramp* under Year 2050 with Alternative 3: Lower-density Mixed-use Revitalization conditions.

Based on the established significance criteria, **one (1) significant cumulative impact** was calculated with the addition of Alternative 3 traffic at the location **bolded and underlined** above since the total delay at this on ramp is more than 15 minutes during the a.m. and p.m. peak hours and the increase in the delay at the ramp meter is greater than 2.0 minutes.

TABLE 13–1
YEAR 2050 WITH ALTERNATIVE 3
INTERSECTION OPERATIONS

Intersection	Control Type	Peak Hour	Year 2050 No-Action Alternative		Year 2050 With Alternative 3		Delay Δ [c]	Sig?
			Delay [a]	LOS [b]	Delay	LOS

Footnotes:

a. Mainline SOV lane geometry taken from PeMS lane configurations at corresponding postmile and validated against field observations.
b. See *Table 6–3* for K and D factors.
c. Passenger-car equivalent flow rate for peak 15-minute period (passenger-cars/hour/lane).
d. Per lane capacity adjusted for freeway segment geometry (passenger-cars/hour/lane).
e. V/C = (Peak Hour Volume/Hourly Capacity)
f. Density measures passenger cars per mile per lane. Density = Flow Rate (passenger-cars/hour/lane) ÷ Speed (average passenger-car speed in mph).
g. Level of Service
h. "Δ" denotes the Proposed Action-induced increase in V/C. Per City Guidelines, a significant impact occurs when the V/C is increased by greater than 0.01 for LOS E and 0.005 for LOS F.

LOS	Density Range (pc/mi/ln)
A	0 – 11
B	> 11 – 18
C	> 18 – 26
D	> 26 – 35
E	> 35 – 45
F	> 45

General Note:

1. M = Mainline
2. A = Auxiliary
3. Sig? = Significant impact, yes or no. **Bold** typeface and shading represent a significant impact.
4. "—" Indicates density exceeds the maximum threshold for LOS F.

	PM	655	318	337	64	8,425	337
Δ	**AM**			**174**	**31**	**4,338**	**174**
	PM			**150**	**28**	**3,750**	**150**

Footnotes:

a. Peak Hour Flow "D" is the traffic that desires to enter the freeway at this on-ramp during the peak hour.

b. Discharge Rate "R" is the *most restrictive* rate at which the ramp meter (signal) discharges traffic on to the freeway (See *Appendix B* for the ramp meter data obtained from Caltrans).

c. Excess Demand "E" is the difference between the Peak Hour Flow and the Discharge Rate.

d. Delay in minutes per lane experienced by each vehicle, calculated as the ratio of the Excess Demand and the Peak Hour Flow in one minute.

e. Queue per lane is reported in feet and is calculated as 25 feet per vehicle.

General Note:

1. SOV – Single Occupancy Vehicle Lane
2. Δ – Increase in delay and queue length due to the Proposed Action.
3. **Bold** typeface and shading represent a significant impact.

13.5 Significant Impacts and Mitigation Measures

Alternative 3 results in fewer significant cumulative impacts as compared to Alternative 2. Alternative 3: Lower-density Mixed-use Revitalization would have significant cumulative impacts at **23** intersections, on **25** street segments, on **10** freeways segments, and at **one (1)** ramp meter.

Physical mitigation measures are recommended for locations impacted by the Proposed Action alternative to reduce impacts to less than significant. Together with Caltrans, SANDAG has prepared a concept plan for reconstructing the I-5/Old Town Avenue interchange that would improve access to the OTC Site as well as reduce area traffic on local streets. This network improvement is proposed as mitigation for several impacted locations. As part of this major infrastructure improvement, the existing I-5/Old Town Avenue interchange would be replaced with a new bridge and reconfigured on- and off-ramps. This project would include: a high-occupancy vehicle (HOV) direct access ramp into the future on-site transit center to/from southbound I-5 (only under the Alternative 4 and Alternative 5 scenarios where the transit center is consolidated on the OTC Site); direct access ramps to the OTC Site to/from I-5, the reconstruction and widening of the I-5/Old Town Avenue interchange; and the realignment and signalization of the Pacific Highway/Barnett Avenue intersection. With the enhanced capacity of the new interchange and direct access to the site, traffic volumes accessing the OTC Site would shift to the new interchange, thus reducing volumes on Pacific Highway, Camino Del Rio W., Hancock Street, Witherby Street and surrounding surface streets. A concept plan showing this improvement is depicted later on in *Section 29.0* of this report.

For locations where improvements have been deemed unavoidable either due to physical constraints, right-of-way constraints, or jurisdictional constraints and where the reconstructed interchange would not fully mitigate, it is recommended that the Proposed Action alternative contribute to the implementation of Transportation Systems Management (TSM) technology to improve traffic operations along various corridors. The City of San Diego includes future traffic signal communication network elements in their Traffic Signal Communications Master Plan (2014). Part of the Master Plan would be to implement an Intelligent Transportation Systems (ITS) program on key transportation corridors within the City. ITS is a fully responsive system that can be used to benefit all modes of travel including motorists, bicyclists, pedestrians, transit and emergency vehicles. The recommendation to contribute to implementation of ITS measures for locations where significant impacts are unavoidable is included below.

Additionally, implementation of Transportation Demand Management (TDM) measures by individual projects within the OTC Site as they are developed would reduce vehicular traffic and help lessen traffic impacts on study area intersections, street segments, and freeway segments. A TDM plan is a valuable tool to reducing single-occupancy vehicle (SOV) trips and therefore recommended for the Proposed Action alternatives. Further details on TDM and TSM measures are provided later on in *Sections 27.0 and 28.0* of this report, respectively.

Table 13–5 lists the significantly impacted locations and proposed mitigation measures.

Figure 13–1 shows an illustration of the significantly impacted locations.

TABLE 13–5
YEAR 2050 WITH ALTERNATIVE 3 SIGNIFICANT IMPACTS AND MITIGATION MEASURES

ID	#	Location	Jur.	Mitigation Measures	Mit.? (Y/N)
INTERSECTIONS					
Alt 3-I-1	6	Pacific Hwy/ Rosecrans St/ Taylor St	San Diego	Per the Midway-Pacific Highway Community Plan, improvements are planned at this intersection. The Community Plan proposes to provide a second southbound left-turn lane, a westbound right-turn overlap phase, and a second northbound right-turn lane. Implementation of the Community Plan improvements would mitigate the impact to below a level of significance. Alternatively, together with Caltrans, SANDAG has prepared a concept plan for reconstructing the I-5/Old Town Avenue interchange. As part of this major infrastructure improvement, the existing I-5/Old Town Avenue interchange would be replaced with a new bridge and reconfigured on- and off-ramps. This project would include: direct access ramps to the OTC Site to/from I-5, the reconstruction and widening of the I-5/Old Town Avenue interchange; and the realignment and signalization of the Pacific Highway/Barnett Avenue intersection. With the enhanced capacity of the new interchange and direct access to the site, traffic volumes accessing the OTC Site would shift to the new interchange, thus reducing volumes on Pacific Highway, Camino Del Rio W., Hancock Street, Witherby Street and surrounding surface streets. Construction of the interchange improvements would mitigate the impact to below a level of significance.	Yes
Alt 3-I-2	7	Rosecrans St/ Jefferson St	San Diego	There are no planned improvements in the Midway-Pacific Highway Community Plan at this intersection. Installation of a traffic signal at this intersection would improve operations at this intersection. However, the intersection is located within close proximity to the Rosecrans Street/Taylor Street/ Pacific Highway signalized intersection (350 feet) which would be less than ideal for installing a signal and it would not be expected that the intersection would meet signal warrants given the very low minor street volumes on Jefferson Street. The provision of an additional signal on this segment of Rosecrans Street where heavy through traffic is observed would not be beneficial to the major street traffic flow. Based on these findings, no improvements are recommended and the impact at this intersection remains significant and unavoidable. Given that the impact at this location remains significant and unavoidable, it is recommended the Proposed Action alternative prepare a TDM plan as outlined in *Section 27.0* of this report and participate in the implementation of TSM measures described in *Section 28.0*. These measures will partially mitigate this significant impact.	No

TABLE 13–5
YEAR 2050 WITH ALTERNATIVE 3 SIGNIFICANT IMPACTS AND MITIGATION MEASURES

ID	#	Location	Jur.	Mitigation Measures	Mit.? (Y/N)
Alt 3-I-3	8	Camino Del Rio W/ Hancock St	San Diego	The intersection is built out with regard to available right-of-way. Additional through lanes on Camino Del Rio West are needed to improve operations at this intersection. However, given the lack of available right-of-way, widening at this intersection is infeasible. Together with Caltrans, SANDAG has prepared a concept plan for reconstructing the I-5/Old Town Avenue interchange. As part of this major infrastructure improvement, the existing I-5/Old Town Avenue interchange would be replaced with a new bridge and reconfigured on- and off-ramps. This project would include: direct access ramps to the OTC Site to/from I-5, the reconstruction and widening of the I-5/Old Town Avenue interchange; and the realignment and signalization of the Pacific Highway/Barnett Avenue intersection. With the enhanced capacity of the new interchange and direct access to the site, traffic volumes accessing the OTC Site would shift to the new interchange, thus reducing volumes on Pacific Highway, Camino Del Rio W., Hancock Street, Witherby Street and surrounding surface streets. Construction of the interchange improvements would mitigate the impact to below a level of significance.	Yes
Alt 3-I-4	11	Rosecrans St/ Sports Arena Blvd/ Camino Del Rio W	San Diego	Per the Midway-Pacific Highway Community Plan, improvements are planned at this intersection to reconfigure the existing geometry. The Community Plan proposes to remove the southbound free right-turn movement from Camino Del Rio West onto Sports Arena Boulevard and replace it with an exclusive right-turn lane. The planned improvements allow southbound movements to continue on Sports Arena Boulevard through the intersection. Notably, vehicles would still not be able to access the southern leg of Sports Arena Boulevard from westbound Rosecrans Street or southwest bound Camino del Rio West. With the improvements proposed at this intersection, the Community Plan reports LOS D results. The additional traffic added by the Proposed Action alternative would degrade intersection operations to significant levels. Any improvements beyond those recommended in the Community Plan are physically infeasible given the lack of available right-of-way. Therefore, it is recommended the Proposed Action alternative implement the Community Plan improvements, where feasible, and the impact at this intersection will remain significant and unavoidable. Given that the impact at this location remains significant and unavoidable, it is recommended the Proposed Action alternative prepare a TDM plan as outlined in *Section 27.0* of this report and participate in the implementation of TSM measures described in *Section 28.0*. These measures will partially mitigate this significant impact.	No
